Guess the Internet made the deals much less attractive. Seemed like the
last few I went to only had a few vendors in multiple spots. The show wasn't
worth the price anymore but they added seminars that I thought were.
Various subjects including Linux. Evidently a lot of people didn't agree.
Didn't make it last year but year before was only 2 not full rooms. Hard to
imagine what was such a huge show could go away.

Here's what the organizers have to say.

Can't imagine how but then again couldn't understand how they did it the
first time, in Dayton anyway.
Never went to another non Atari show that I wanted to go back to.

Well this coming weekend September 9 is the ACEC Swap Meet. Though not
a very big event it's Atari themed. http://acec.atari.org/

Classic Computer and Video Game items for Sale/Trade
http://fmhcentral.freeservers.com/

Don't know about that one, but here is a link to some others:

http://www.atariage.com/features/events/index.php

Hope this helps. :)

On the STacy, well under it, is a small metal access door that
is held on by one screw. Under the door are 2 Socketed
chips.

Are these the TOS 1.4 chips or are these something else?

If they happen to be TOS chips, Can one plug in 2 TOS
2.06 chips?

Ok well I got it all set up all everyone has to do it goto.

telnet://stguild-bbs.dyndns.org

And they get to my bbs all the time. I really could use some people who are
willing to upload and help out.

I started going to the Dayton Computerfest about 1985, and went almost every year until around 2000. But (IMO) online computer sales and auctions have killed off most of the business that the vendors traveling the computer show circuit once enjoyed. Check the announcement at: http://www.dma.org/
For maybe 8-10 years, DMA also had a spring computerfest, and I could see it wither as the years went on. Then they dropped it. Other computer shows that once were pervasive have suffered the same fate. Just as the PC's crowded out the other platforms, the internet sales have crowded out the shows. It is regrettable, but evidently there were lots of people like me -- why travel to a show, fight the crowds, and have an inferior selection/price as compared to what is available as I surf the net? And if you are a seller, why not set up a site on the internet instead of loading up equipment, driving, setting up, etc.

Have a look here:

http://www.system-cfg.com/pages/atari_stacy.html

Further down the page, you can see 2 chips with adhesive tape. These are the
2 EPROMS containing the TOS (not necessarily 1.4).

Upgrading to 2.06 (which is possible on the stacy, according to
http://gem.win.co.nz/hall/tos_206/guide206.zip) would be much easier compared
to doing so for an ST since you'd only have 2 chips to program (presumably 2
27C1001 eproms or compatible).

One chip should hold the LSB and the other the MSB of TOS 2.06 (which is
which should be marked on the motherboard).

All you need is someone with the right EPROM programmer and the TOS roms split over 2 files (LSB/MSB). Perhaps you need to configure jumpers so that the machine knows of the bigger size EPROMs.

How much would you like to pay?  Given that 1Mbit EPROMs are hanging about
�5ea. at the moment, �15+postage.

(yes �5 may be expensive people, but I'm not putting myself out to save a
few quid, walk down road into shop, hand money over, thank you grubby
electronics person)

Hi,

Could anyone shed any light on a TOS version 108?? It doesn't exist?

The image that follows explains all;
http://www.logicsays.com/ebay/01_09_06/image7.jpg

I've tried it with 1.4, 1.62, 2.06 and it's not playing ball. I had it running on a machine months ago which I don't have any more.

Any suggestions? I've just sold it. And from what I'm finding out through searching it's ultra rare.

Thanks in advance,

Alison

Oh, the disks are also unreadable too. I don't think they're corrupt, more the OTT copy protection that they used with it. It is mentioned on some of the other forums as being difficult to crack, in that the few cracked versions out there regularly crash.

Greetings everyone!

Here are the lucky, the few, the proud winners of this months prizes at The
DarkForce! BBS:

August 2006
1. ST Magazine - Mega/STe wins the free 3 mag. subscription

Congratulations to our winner!

Also, here is next months prize:

September 2006
1. ST Magazine - some lucky Atari caller will win a free 3 mag.
subscription.

Good luck to all! :-)

Aerodynamic salmon? Are you for real?

--

There are several things that I will never be:
  * I will never be attracted to females.
  * I will never enjoy the company of others.
Exactly how these realities bode for my enemy, is not of my concern.

I must be dense - when I hooked the yellow wire from the Mega STe harness
to the yellow wire on the AT style P/S, thats when everything fried.

When I hook the blue wire from the Mega STe harness to the yellow wire on
the AT style P/S, the machine boots up okay.

the blue things are small inductors, just to filter out spikes when bad people plug stuff in with the power on, you can bridge them over for quick testing.

I hae not done the calculations, but since the HSYNC is sync'd to the
4.433MHz PAL burst, you can expcet some rather odd numbers.

>> I am not sure about NTSC, though.
>
>That has a 32.215905 MHz crystal.

And AFAIR, they used a fixed oscillator and no PLL for NTSC - however, I do
not know enough video format details to understand *why* this worked.

>Which is nearly 14.31818.. MHz * 9/4
>Using precise values, 4 times NTSC times 9/4 is 32.21590909... MHz
>So it seems that Atari used the rounded off value of 14.31818 MHz.

Or maybe it is correct that way - some video formats employ
near-but-not-completely integer multiples for various reasons - see for
example the section n why the vertical frequency is now 59.94005Hz in
http://en.wikipedia.org/wiki/NTSC

>Oh well, I think I shall use NTSC based values for both PAL and NTSC
>versions.
>Most modern TVs that use PAL also have SCART (PERITEL) sockets for analogue
>RGB input, while NTSC TVs do not. I see the circuit just uses a
>32.21590909... MHz oscillator block for the Peritel-output version.

That should work. These odd frequencies are only for FBAS, when using RGB
output, 32MHz should work fine.

>The Amiga sensibly used a single 14.31818.. MHz crystal and halved it for
>the CPU clock.

Which is probably not enough for PAL: you then need to sync the 4.433MHz
color burst to the HSYNC - the Atari method makes sense, too.

cu

I'll check again before it goes back in the box.... yellow is +12v, blue
is -12v. Just checked it.

Brad may be wrong. Personally I'd go by the positions on the board and what
a multimeter tells me rather than rely on colours.

This PSU here is also a 100-240v switchmode.. Is yours the same? Could you take a photo of the label?

Have to disagree there. Temperature, over or under voltage, variations in
crystal composition, ancillary components. 8Mhz does not mean 8Mhz. Also
the higher the frequency, the more unstable it is. Multiple harmonics there
too.

>

Maybe the 8.010613 was a bodged batch of a few million crystals that were going cheap at the time. We've seen numerous examples of this, particularly with electronics through the 1980's. I think it was Sinclair that bought a few million dud chips on the cheap.

Sorry to say this OP, but if you know so much about the subject and are so worldly clever and infinite, then why on earth are you on here asking these questions to us mere mortals.

Apologies for not meeting your expectations, and if you don't like the replies you're getting then what on earth ever possessed you to post on Usenet in the first place?

Maybe post these questions on the sci.electronics groups and take the same approach, for on here we're quite tame.

As someone who has changed crystal frequencies a lot, by rubbing them with a number 2 pencil lead, or cleaning them with an abrasive cleaner, I do not assume that more than four digits really mean anything. There are many reasons for production tolerances, and being on the low side can be fatal for an application, just as being on the high side can be fatal for others.

And, the operating frequency does vary with frequency, and that characteristic is not on my copy of circuit drawings. If one had the normal decrease with increasing temperature, one would spec on the high side.

Does anybody remember Workman Electronics? They bought transistor rejects from TI, mostly, which did not meet gain vs frequency requirements, but would work in many applications? The sorted them by gain at a suitably low frequency into three piles, and sold them.

This should be good for another thread or two.

Jim

I am so tempted to bid and try and win it, but am sure the SO will not
be too pleased. ;-)

Hmmm.. I've not played with Atari software for a while.. what is the
latest on MagicMac (English version)?

Exactly the same result I got. You can't mistake that with a multimeter.
  Yellow is 100% +12v, check continuity between the hard drive power
connector and pin 3. As I posted earlier this is what I measured,

pin 1 Orange +12v (power good)
pin 2 NC
pin 3 yellow +12v
pin 4 -12v (thought so)
pin 5 - 8 Ground
pin 9 White -5v
pin 10 - 12 +5v

>

My MegaSTE is at work, I will cross reference tomorrow for you.

It sounds like the serial ports were given +12v instead of -12v. Those
blue things (inductors) are there to protect the port, if they have
blown it will mean the serial ports are open cct. Ask any Amiga owner;-).

There is another possibility, that there are more than one flavour of
MegaSTE and PSU. But I doubt it, although Atari......

Indeed, the on-line calculator for my programmable oscillator failed to find an accurate ratio.

Good point. Puzzles me too.

>>So it seems that Atari used the rounded off value of 14.31818 MHz.

> example the section on why the vertical frequency is now 59.94005 Hz in
> http://en.wikipedia.org/wiki/NTSC

Yes, there is a factor of 1.001 involved, but
32 / 1.001 = 31.968031 and
32.215905 / 32 = 1.00674703125.

>>The Amiga sensibly used a single 14.31818.. MHz crystal and halved it for
>>the CPU clock.
>
> Which is probably not enough for PAL: you then need to sync the 4.433 MHz
> colour burst to the HSYNC - the Atari method makes sense, too.

I've managed to get a machine running off an 14.318.. MHz crystal for the main memory cycles with another crystal for the PAL carrier. It is no problem, the modulator chip restarts the colour carrier oscillator after every HSYNC.

I think what Atari did was to have the PAL oscillator nudging the master clock oscillator into sync, which sounds a bit iffy to me. I think the right thing would have been to have HSYNC kicking the PAL oscillator, like modulator chips do. That way the master clock doesn't need any special relation to the colour carrier.

Cheers Derryck... I see it has not been updated for 18 or so months...

Hmmm... anywhere in the UK sell this? I've been so out of touch with
the Atari market for so long. I guess I'll call Karl at System
Solutions to see what they can do - I have a copy of MagiCPC - maybe
they will do a cross-grade. :-)

In any case, Derryck, when is the next CCC?

>> No. If you ask for an 8 MHz crystal, you will get one.
> Have to disagree there. Temperature, over or under voltage, variations in
> crystal composition, ancillary components.

Yes, actual frequency will vary from what it says on the tin.

> 8 MHz does not mean 8 MHz.

It does mean that is the frequency the manufacturer is trying to provide, and is the one you get give or take the variation due to the conditions you mentioned quoted on the data sheet.

Mind you, they usually round off markings for values with many digits. The NTSC carrier value is 315/88 which gives endless recurring digits. The PAL carrier is 8 digits. Crystals are steady enough but seldom spot-on, and colour carrier oscillators have to be more accurate so they have trimmer caps to fine tune the crystal.

> the higher the frequency, the more unstable it is.
> Multiple harmonics there too.

Agreed but 8 MHz is reasonably low, and 32 MHz is not too high.

> Maybe the 8.010613 was a bodged batch of a few million crystals that were
> going cheap at the time.

Possible, but I don't think it is likely. Atari were big, and wouldn't have to make do with out of spec components.

> I think it was Sinclair that bought a
> few million dud chips on the cheap.

He appreciated the fact that things could be less than perfect but still useful.
Early on he sold under-spec transistors to hobbyists who didn't need perfection.
Later on he bought 64Kx1 DRAM chips with memory defects confined to one half of the memory array, and used them as perfectly adequate 32Kx1 chips.
Certainly beat using two perfect 16Kx1 chips that needed extra power rails.

> Sorry to say this OP, but if you know so much about the subject and are so
> worldly clever and infinite

I am reasonably acquainted with electronic video systems but not infinitely so.
The reason for the Atari crystal frequencies isn't obvious to me, hence I'm asking.

> then why on earth are you on here asking these
> questions to us mere mortals.

Because it is a crystal in an Atari STE, and this is a group of Atari ST users.

> Apologies for not meeting your expectations, and if you don't like the
> replies you're getting then what on earth ever possessed you to post on
> Usenet in the first place?

Sorry for being read as brusque. I read the responses and explained why some suggestions could not be or probably were not the case.
If I write "No." that doesn't mean "No, duh!", it means "No, I haven't found that so in my experience but of course being human I may be wrong".

> Maybe post these questions on the sci.electronics groups and take the same
> approach, for on here we're quite tame.

I was thinking of doing so but for now I think I can proceed with 32 MHz (not Atari variant) crystal timing without problems. Video output will be RGB to TV or monitor so colour carriers won't be needed. If they ever are, it won't be hard to retrofit.

Weren't you a ZX81 owner? I didn't know you were into STs as well.

;-)

Well we are trying to de-clutter at home at the moment, so it would not
really be good of me to add any more... so a software solution like
MagicMacX would be perfect.

I hear divorce is a good way to get rid of most of your clutter in one fell swoop, and the alimony payments stop you accumulating any more.

On the off chance that there's someone near Bonn Germany reading this
newsgroup just now, I have some Atari hardware to get rid of:

- 1 x standard Atari STf (TOS 1.04 chips), works great

- 1 x Atari STf, doesn't boot up at all anymore, but contains the
interesting Gigatron OHG RAM expansion discussed on this newsgroup, so
presumably either the ST or the RAM expansion will be functional if the
two are separated

- 3 x Atari SM124 black & white monitor, work great

- 1 Logitech Atari mouse, works great

- some manner of Medusa-like serial cable with both DB-9 and DB-25
connectors at both ends

- an assortment of disks

I don't have anything to pack them up in, so this is for local pickup
only. If interested in any of it, please make me an offer by emailing
atari st at ryandesign dot com. Thanks.

I think I can help, as I have an ICD Link in my cables box. Contact me
at the letter "k" followed by @uia.net.

Hm - not sure, but I think this might destroy the phase relationship between
adjacent lines that is required by PAL. It should work for NTSC, though.

>I think what Atari did was to have the PAL oscillator nudging the master
>clock oscillator into sync, which sounds a bit iffy to me. I think the right

It is just a PLL (although with a high divider ratio). The scheme has the
benefit of keeping the PAL oscillator running, which avoids phase shifts
between lines.

It really is okay, signal transmitters send a burst of pure colour carrier soon after HSYNC so that the receiver has a reference to work with. It doesn't matter if the phase of the reference varies every line, only the phase encoding w.r.t. that reference alternates every line.

It doesn't look like a proper Phase Locked Loop, in that there is no phase detector, divider or VCO. Instead, the PAL oscillator signal seems to nudge the master oscillator. It might have a similar result as a PLL, but I don't think it is one.

Maybe I do not understand the english well...
I cannot understand Cyril, why does he not want to use paypal to pay you if he has a free paypal account ?
It's easy and free...the small 4% charge you pay on 5 $ is ...0.2$...and YOU lost it, not him...
So ?

Cyril ??

The orange wire is a POWER GOOD line...
So the 0.4V is not really to be considered as a power source...
It is an open collector output from the PSU telling the hardware (the reset circuitry if I well remember ?) that the PSU init is end and all voltages rized correctly to their respective good level...

Regards

Hello,
```

More work to improve usage of 060 cpu, this time, along with usual fixes:

PmDoom 0.54:
- Optimized a bit for 060 cpu.

PmHeretic 0.54:
- Fixed low/high detail message.
- Fixed weapon drawing in low detail.
- Missing i_system.h file in sources.
- Atari: more rendering optimizations, special 060 routine.

PmHexen 0.54:
- Added low/high detail message.
- Fixed weapon drawing in low detail.
- Atari: more rendering optimizations, special 060 routine.
- Rewritten CD music player for SDL.
- Fixed crash in audio on exit.
- Unrolled 4x rendering loops, a bit faster.

AFAIK, analog PAL receivers delay the color information by 63.943us (1 line minus 180 degrees) and add/subtract that with the current line to cancel out phase shifts - that would cause problems with shifting reference bursts.

>It doesn't look like a proper Phase Locked Loop, in that there is no phase

Hm - I just had a look at the schematics. I could not find the PAL version of the MST schematic, but in the MSTE schematic (page 2, "stuffed in PAL systems only"):

It seems that the 4.433MHz clock and HSYNC run into a phase comparator (U203B, 74LS74), the output is low-pass filtered (R208, C212), and that voltage is used to control the frequency of the 32.xxxMHz VCXO (cap diodes D202, D203, ... Q202) - this definitely looks like a PLL to me, although I might be wrong, I am more into digital design. The divider is buried inside the ST chip set, since the HSYNC signal is basically the 32.xxxMHz system clock divided down by some large number, closing the loop.

You're probably right, I'm rather rusty on analogue that I don't use often.
I recall a similar trick being used for a frame grabber where a 6845
generated the pixel addresses and a VCO was synced to the source video via
HSYNC.

I also have a poor scan of the circuit, it is a bit hard to read the details
clearly.

Now that I'm selling it on eBay I got around to taking a photo of the
RAM expansion, in case anyone is curious:

Hi Ronald,

I got a bit lost with your explanation -- did you match AT voltages exactly or the AT supply's colored wires exactly?

The reason I ask is that Steve Sweet stated twice (2000 & 2002) that an AT supply could just be plugged into the MegaSTE. I've never even seen the inside of a MegaSTE, so I didn't volunteer information, but I would like to know exactly how your supply got wired for future use.

For what it's worth, the -12V (which you seem to have fried) is used mostly by the serial port circuitry. The +12V is used mostly for the floppy drive motor.

Galen

Color coded wires exactly - blue to blue, yellow to yellow, etc,...

Ok, I certainly don't want to tell anybody wrong here. This is apparenty tricky stuff, and its also apparently not etched in stone.

Many users, so of whom I know are very technically "savvy" when it comes to this stuff have told me that I should be able to hook an AT (note thats

NOT ATX style) style P/S straight up to my Mega STe. The pinouts on the wiring harness of the Mega STe appear to match up exactly with an AT style P/S.

With all that in mind, when I hooked it straight up, thats when the blue things on my Mega STe's MB went snap/crackle/pop, burnt smell. When I hooked it up like I did my Falcon (blue atari wire to yellow AT P/S wire) then it boots up.

So whats a person to do? What has been suggested a couple of times already, at the end of the day, only trust a multimeter and read the voltages yourself, before hooking anything up. Thats my opinion.

Thanks, I guess that sort of makes sense then.

If you don't mind, I'm going to e-mail some pics to your address, since its not good newsgroup "etiquette" to post them here. Just want to let you see some of the stuff I've found, been shown...

It's been a LONG time since I had an AT PSU hooked up to my Mega STe but if I remember correctly, it hooks right up IN REVERSE. That is the black wires aren't in the middle but on the edges! This is likely what bit you. Match voltages to be sure.

Thanks,
Mark

Hi Mark.

I'm not sure (after all I've read I just get more confused) but I really
don't think thats it. I'll send you a couple of pics via e-mail as well.

Thanks.

If you hook it up in reverse you will fry it. Ground is in the middle,
same as an AT PSU. My multimeter confirms this too. There has to be more
to Ron's dilemma.
Colour coding is irrelevent, manufacturers could have made the wire
purple or pink. What matters is the voltage levels.
Can you post me the pics too Ron? Be interested in having a look.

Mark

There's a thought.

Got a spare one (older) here right now. Its one of those that the 2 white connectors plug in side by side on at PC motherboard.

I've cut off one of the dead Mega STe's power supply harnesses.

All the red (+5v) matched up (3 leads)
All the black matched up (4 leads)
A single white lead matches up

That leaves a yellow, blue, and orange on each.

My understanding is that blue on Atari P/S's is +12v, and that yellow on the PC power supply is +12v.

So I can't just color-code connect, straight across.

On my Falcon, before I hooked my CT60 up to it, I had to hook the blue
lead (+12v) from the Falcons harness to the yellow on the ATX power
supply. I'm assuming (dangerous!) that I have to do that here as well.

Which leaves the PC side blue and orange leads.
Which leaves the Mega STe side yellow and orange leads.

Anyone done this before and can tell me for sure, what goes where before I
actually connect and attempt powering up?

Thanks much gang! :)

Mark, thats a generous offer and I sure do appreciate it. :)

Let me try getting this spare PC power supply wired up first though. If I can get it to work, it should do until I can get a real Mega STe P/S.

Thanks again! :)

Thanks, there is a ton of useful info there. Probably a bit too advanced for what I can do though... :(

I'm gonna try to get the spare PC power supply I have here hooked up, just to tide me over.

Thanks again.

I've got 2, already hacked the harness off the (really!) dead one. If you guys think you can repair the other one, I'll be glad to send it to you!

> Mmmm. You might be able to codge an PC ATX power supply even.

Thats the direction I'm going to try first. Others have suggested it as

well. I did wire up an ATX power supply with my Falcon, when I recased it,
before I got my CT60. It wasn't that hard. I'd be happy to have this
working until I can get a real Mega STe P/S again.

I'm not sure about the connections on the Mega STe's harness though. (see
my other post)

Anyone have experience with this, done it before? Thanks! :)

Hi all,

Originally distributed on the Centek website, Cecile is a harddisk driver for Atari or compatible systems. David Godec has kindly decided to release the sources for Cecile under the General Public License, GPL. After the sources for AHDI surfaced recently, the sources for two Atari harddisk driver are now available. However, Cecile is the first one to be released under GPL.

Didn't you have this problem not to long ago about the psu giving up ? wonder if its just overheating ? updating the drive fets for something of more today spec could be the way to go. Low ESR caps would improve things a great deal also. If the transformer is giving out then theres not much that can be done. Have you any idea on whats failed ?

chris

Are we in a position to repair his PSUs?  Do you still have a variac to get
110v??

I do have a 240v Mega STE back home....  And if you give me a week or two I
can come back with the pinouts from the power supply connector.

Don't worry Ron, help is on the way :)  Quite impressed with how you do this
for the Atari community and I'm sure others are too.  :-)

Gosh, thank you very much! Personally, I'm just glad to be able to return
a little bit of what the Atari community has given/done for me over the
years... :)

Hi Chris.

I replaced the first P/S with a used Mega STe P/S that I won in an auction off Ebay and everything started working again, so I assumed the first one was dead.

What it did at that time was give a white screen, or sometimes a white screen with rows of yellow blocks on it.

It did the same thing this time... so I'm assuming the same. But I don't really know for sure what exactly has failed...

Thanks.

Huh?  I figured you were floating in cash, being that you were offering
$25/month prizes to callers of your bbs.  That's $300 per annum just tossed
away.

I definitely would not rely on the the colors of the wire's insulators as a guide for wiring up the machine. At best it will not work. At worst, it will totally fry your ST.

Do some searches on Google and find out exactly what each wire is for on the ST's original power supply.   Perhaps somebody in the ST group can pull out a multimeter and check each line for you.   As for the AT power supply, you can use a multimeter to determine which wire corresponds to which wire on the ST.

Is this some kind of contest or something?   You know, where the first
Atarian from Baltimore wins a prize if they email you within nine minutes
or something?   If so, I might be from Baltimore.   I'm not, of course, but
I could be... If there were something in it for me. :-p

hmmm, im sure ive seen that problem before, have you tried your old psu back
in again ? Sounds more like a ram problem, normally you don't get as far as
a white screen if the psu is bad....

Chris

Well I have done it and it does work. I used it as a way to bench test
my MegaSTE's. IIRC (and its been a while) the MegaSTE uses the same pin
configuration as an AT PSU. All you have to do is make sure that the
black wires are side by side i.e. in the middle of the block.

http://pinouts.ru/Power/MotherboardPower_pinout.shtml

Just looking at a MegaSTE atm, and it is pin for pin perfect. Pin 2
(+5v) is not used, nor is there even a pin for it on the motherboard.

In fact even the colour coding is identical on the example I have to hand.

Mark

Its the Mega STe so I can pull the ram chips very easily - there in that lift up compartment right in the front. I can pull them, add them back in 1 at a time and try to see if one has gone bad.

I'll do that tomorrow and report back.

Thanks for the suggestion.

Hardly. I'm a respiratory therapist, working at a small, rural hospital in E. Kentucky. I make pretty good money (for this area). My wife is an RN who works in home health. Together we bring in about 70k a year. Of course there are bills, mortgaged land/home, 3 cars (only 1 not paid for), and did I mention we have 3 kids? :)

As far as money going to support the Atari community being "just tossed away"...with an atitude like that, why are you even here friend? I do not in any way, shape, form, or fashion consider it money wasted. You're entitled to your own opinion of course...

See ya.

Hmm, Mark are you sure? Mind you, I'm not doubting what you are saying -
its just that I thought the blue wire on the Atari was +12v and had to be
plugged into the yellow from the P/S itself, because the yellow there is
+12v and blue is -12v.

Mind you this is from my experience from hooking up my Falcon to a ATX
style power supply. I know I had to do that with the Falcon and the ATX
one. I figured the blue on the Mega STe would be the same. I do know that
the wiring on an AT P/S and ATX P/S is slightly different.

Anyway to verify the Mega STe what the Mega STe is?

Thanks for the help!

The Falcon is completely different. IIRC you are right in that regard. The Falcon uses blue for 12v. Have a look in the myatari archives, I did an article on replacing the PSU. Can't recall if it was ST or Falcon tho. But I do remember what you are saying.

As I said I have hooked up 3 MegaSTE's directly to AT power supplies and they worked fine. I will have a look around at home this weekend, for my notes to confirm the pinouts.

BTW I don't think even Atari would mix colour coding for 12v on these PSU's.

Stuff it, I have a multimeter and MegaSTE handy........

OK MegaSTE

pin 1 Orange +12v (power good)
pin 2 NC
pin 3 yellow +12v
pin 4 -12v (thought so)
pin 5 - 8 Ground
pin 9 White -5v
pin 10 - 12 +5v

There ya go;-) It is standard AT.

Mark

You have to do 2 chips at a time. They are banked in a staggered
fashion. Slots 1 - 3 (Bank 1), Slots 0 - 2 (Bank 0). One chip won't work.

If you need ram mail me I have a box of 1meg simms lying around.

Mark

Very exciting stuff regarding the CTPCI! Can't wait until such a
solution
is ready and installed here :))

Does anyone know where to get the Sapphire All-In-Wonder VE 64 MB PCI?

Okay, this has been a (painful) learning experience for me.

Here is what I've found (I think) so far.

I believe that the original culprit was memory. After removing, trying various combos (diff banks and chips) then reseating the original 4 megs, using the AT style P/S, I can boot up to a desktop.

However, its what happened before...or as Paul Harvey says, "the rest of the story"... :(

I wired the AT style P/S straight to the Mega STe connector, following the color coding exactly.

Hooked it up - turned it on - pop! sizzle! burning smell! Had my hand right on the switch so I immediately turned it off. I checked the board, and sure enough, the row of small blue chips (I'm not sure what to call them) at the back, next to the serial port and another port have 2 that look burnt.

So I've not much to lose at this point, so I re-wire the AT supply like I did my Falcon when I had it hooked up to an ATX P/S (pre CT60). That is, the blue wire from the Mega STe connector goes to the yellow wire on the AT P/S. Leaving the blue wire from the AT P/S, and the yellow wire from the Mega STe connector, unconnected.

Plug it in, turn it on - boots up normally, to a desktop. Problems -

nothing works through the serial port (modem 1) now. Also, the screen is slightly "flickery". Its also unstable. I get random 2 bomb crashes, but not lock ups - at least a the reset button or <control> <alt> <delete> does reset everything.

So to sum it up, I think the memory was prob. the intial problem, although I still can't get it to boot up at all with the original Mega STe P/S. Its deader than a doornail with it connected. So I guess thats dead as well.

I guess I'll wait until I get some money saved up, send the Mega STe to somebody like Alex at ATY Computers and see if he can salvage what I've done.

Thats the bad news. See next message...

Okay, I decided to take another stab at the MFP chip that I had attempted to do the RSVE upgrade on, and apparently, I've got it good enough for government work, as they say.

So we're back online...

and thats the good news folks.

Just tried it, comes up so good news!

You could send your old PSU to me if the postage isn't too high, if your not in a rush for it back I will take a look and see if I can make it "Ronald Proof"   ;-)

Chris

I notice my STE has
32.084988 for the main logic and CPU
8.010613 for the FDC

I am curious as to why Atari chose these seemingly arbitrary and unrelated
frequencies for the CPU and FDC clocks.

32 was for the video circuit, STE is a bit different though on a STFM you
will find the 32 is pluged into the shifter for the video. It then goes to
16mhz for the input of the MMU, which then chucks out 8mhz for the cpu and
4mhz for the sound system. I think there was a 2mhz also for the modem port
I think.

What I meant was why did they use 32.084988 and 8.010613 rather than 32 and 8 MHz exactly. The latter are easy values to find and buy.

0.084988 is 1/11.766367... or roughly 3/35.2991...

I can't see a relation between any of the crystal frequencies and PAL and NTSC colour carriers, which one might do to reduce colour dot crawl for instance.

It isn't needed to correct PAL frame timing, as this uses multiples of 64 us.

NTSC is slightly slower than 60 Hz field rate, so one would expect a crystal slower than 32 MHz.

don't forget the shifter is a cpu in its own right, it has to crunch millions of bits of information 60times a second to output the video. You might want to check out the diagrams for the ST to get a idea on whats going on exactly.

I'm a professional electronic engineer implementing the Atari STE logic (as much as possible) in a single FPGA. I can easily get a 32 MHz crystal and divide it down for 8 MHz etc.

I have the ST circuit diagrams and can understand them well.

What I don't understand is why Atari chose crystal frequencies that are slightly off integer multiples of 1 MHz.

If I have to run several different clock domains this makes implementation harder.

This should work as long as you don't need PAL or NTSC TV output. If you look at the schematics (I remember the ST/MST version), you can see that at least in the PAL version, the 32.xxxMHz clock oscillator is part of a discrete PLL that is sync'd to the 4.433MHz PAL burst - IIRC, the HSYNC signal (which is scaled down from the 32.xxxMHz main clock) is phase-locked to the 4.433MHz clock. AFAIR, this is required to produce PAL-compliant FBAS signals. I am not sure about NTSC, though.

About the FDC: 8.000MHz would have been the correct clock for the FDC, but
the slightly higher clock is still close enough to produce floppy disks that
are exchangeable with other systems. Using the correct 8.000MHz, you can get
a few bytes more per track, which makes it a bit easier to get 11
sectors/track with normal sector gaps.

IMHO the problem with getting 11 tracks is low-power drives. They have enough power to accelerate the disk fast enough to read 11 tracks, but not fast enough to write 11 tracks. I had a drive that would do both, and the bearings were replaced with $75 each aircraft quality bearings, and it died due to stupidity, either mine or of the people who made a circuit to make it write a HD disk. If anyone has a really old disk drive, which still works, I will pay an unreasonable price for it. I had one that was as quiet as a mouse, and would read and write 11 or 22 tracks.

Otherwise, I am a quite old engineer, and know that the cheapest way to accomplish a goal is the one that gets used.

Jim

Thanks for the info.

I suspected something like that, I just could not work out the ratio.
32.084988/4.43361775 = 7.236751071

> I am not sure about NTSC, though.

That has a 32.215905 MHz crystal.
Which is nearly 14.31818.. MHz * 9/4
Using precise values, 4 times NTSC times 9/4 is 32.21590909... MHz
So it seems that Atari used the rounded off value of 14.31818 MHz.
Bad boys!

Oh well, I think I shall use NTSC based values for both PAL and NTSC
versions.
Most modern TVs that use PAL also have SCART (PERITEL) sockets for analogue
RGB input, while NTSC TVs do not. I see the circuit just uses a
32.21590909... MHz oscillator block for the Peritel-output version.

The Amiga sensibly used a single 14.31818.. MHz crystal and halved it for
the CPU clock.

Good news. I think a simple 32 MHz master crystal is the least fuss, and if
anyone really needs colour carrier signals they can go find their own
strange crystals or use a programmable frequency generator chip.

I may get sort for saying this, though isn't 8.010613 just simply wrote as 8mhz ? Some testing I did a while ago, I ran the ST's MMU on my own 16mhz clock and could vary the speed of the entire ST, running on 20mhz the screen went out of sync and the sound system went faster. IMHO I really do not think you need to worry about it that much. As long as your video system is generating the correct video timings then I really do not see a problem ?

The worst that could happen is your scanline finishes a couple of pixels early, or the sound may play a couple of hz out of spec, but im sure over the millions of ST's produced that all this would vary with crystal specs anyway.

If you *really* want to make sure, just get a normal ST, put in an exact crystal and see what happens. I bet if you tested the timings of 100 ST's that none of the ST's would keep exact time anyway.

Isn't it normal to have it a little over anyway ? by the time its gone though a few buffers and dividers it would loose a bit of the "extra speed" anyway.... I could by wrong though IMO I really do not think its going to matter, just stick to the easy numbers....

Chris

No. If you ask for an 8 MHz crystal, you will get one.

These are a standard item.

If someone goes to the trouble of writing 8.010613 on the circuit diagram, they would have had a good reason because a non-common crystal will not be as cheap.

> Some testing I did a while ago, I ran the ST's MMU on my own 16 MHz clock
> and could vary the speed of the entire ST,
> running on 20 MHz the screen went out of sync and the sound system went

> IMHO I really do not think you need to worry about it that much.

Well, you do have to worry because if the video timing is not synchronised with the colour clock you will get dot crawl on TVs using composite or S-video input.

> I'm sure over the millions of ST's produced that all this would vary with
> crystal specs anyway.

That's not the point. The frequencies have to be synchronised within the machine.
It doesn't matter if they are a bit different between machines.
The colour carrier oscillator has a trimmer cap so that the colour carrier frequency can be tweaked to meet the NTSC accuracy.

> I bet if you tested the timings of 100 ST's that none of the ST's would
> keep exact time anyway.

True, but not relevant due to previous point.

> Isn't it normal to have it a little over anyway ?

No.

> by the time its gone though a few buffers and dividers it would loose a
> bit of the "extra speed" anyway....

No, buffer delays do not change the frequency of the signals passing through them.

> I could by wrong though IMO I really do not think its going to matter,
> just stick to the easy numbers....

I shall use 32 MHz exactly and by-pass colour-carrier modulation completely

```
to make the problems void.

Splendid place, I salute your good taste.
It's not Canada, but it is on the border and feels very Canadian.
Do the guys at the market still hurl their aerodynamic salmon across the tables?

D-?   Getting the country wrong is definitely worth an F. ;-)

But it's possible that he was suggesting you were giving Vancouver, British Columbia a bad name -- i.e. People might confuse people from Vancouver, USA with Vancouver, Canada.   I think he might have been suggesting that Vancouver, Canada is better than Vancouver, USA, and sharing the same name, those from the USA give those from Canada a bad name.

But what do I know? I'm just happy that it's not me giving Canucks a bad name. :-p

Hi Ryan

Just plug it in, it will probably work as is without any messing about, the ST PSU has quite an operating latitude, no damage will be done anyway this way around.

Then "digger" it be.

"digging" can mean many things. In this context
it means what I want it to mean; to "dig" into software.

:-)

Wha-huh?! I take the logic board and shield out of the case, *then* I take off the power supply and the shield? Wow, that sure makes things easier than the way I was doing it. Totally didn't realize the logic board could come out at that stage; thought it would still be attached to the case.

So thanks for the link! I had searched for "takeapart" but hadn't gotten to synonyms like "dismantle" yet.

Oh, the one I was taking apart here works fine. It's the other one that's broke. But now I've at least seen inside 'em to compare 'em. The broken one has a "Rev. D" logic board, with the TOS chips under the power supply and the RAM in two long rows at the bottom left. Looks like this one, which is labeled "Rev. C":

http://oldmachines.tripod.com/ActPics/atari_1040open.jpg

The one that works has a different board design, with the RAM chips in a square configuration under the power supply, and the TOS chips on the left. Mine just says "Rev." without a letter next to it. Looks like this one, labeled "Rev. D1":

http://www.wumpus2000.de/Homecomputer%20neu/Computers/Atari-1040ST/Atari-1040ST-10.jpg

Except mine has the 6 TOS ROM chips, not the 2.

So the one interesting feature of my non-working Atari STf is this
memory expansion thing that's installed. I figured you'd like to hear

about it, or maybe can even tell me more about it.

The logic board of this Atari looks like this, though mine is labeled "Rev. D" not "Rev. C":

http://oldmachines.tripod.com/ActPics/atari_1040open.jpg

The square chip in the lower right of the logic board has been removed and a circuit board stuck in its place, and the chip placed back in a socket on the board. The chip is labeled "C025912-38 / JH23-019 / 7A1 03". There are also 8 places where additional chips can be installed on the board; every other one is filled with a chip marked "TOSHIBA 9319TCK / TC514400AZ-60 GER" which seem to be 60-ns RAM chips, though I don't know what capacity. Though since only half of the spots are filled, I'm guessing this is a 2-MB expansion card. From the board there snakes a 20-pin ribbon cable into the left side of the metal box in the center of the logic board where a similar chip hijacking is taking place, this time with a rectangular one marked "C025914-38A / PH23-024 / 6M1 37".

The only identifiable markings on the board are "Gigatron OHG" which seems to be the name of a company that made 2- and 4-MB memory expansion products for the ST back in the day, though my Google search isn't turning up a whole heck of a lot -- just a German article about the existence of the product:

http://www.stcarchiv.de/stc1990/12_ramerw.php

For anyone interested in what the article says, it begins with a lot of palaver over why one would want more RAM, describes Atari's official expansion strategy of soldering more memory chips on top of the existing ones, and then dives into the 3rd-party products which achieve RAM expansion in more sane ways. They mention the RAM piggy-back board strategy, which works a lot like soldering the extra RAM chips directly over the old ones but is a bit cleaner. And they talk about the MMU piggy-back strategy, which seems to be what this Gigatron product does. (So I guess this "C025912-38" chip is the MMU.) The article goes on to mention MMU piggy-back upgrades from two other companies.

I was surprised to hear about an MMU -- based on my experience with 8-MHz 68000-based Macintosh computers I hadn't expected the Atari ST to have one, since the Macs don't.

This Atari doesn't turn on anymore (red light on keyboard, that's about all) so it's hard to figure much out about this expansion card. Months ago, when it did at least turn on and sometimes boot into TOS, I got Notator started a couple times and the free memory was much more than usual on my functioning 1MB ST. I also once got a newer version of TOS booted from floppy which did a RAM test and I want to say it listed 2.5MB but I don't remember for sure.

I had wanted to remove the expansion to see if it's the cause of this Atari's problems, but I can't even physically remove the MMU from its socket in the Gigatron board. I don't want to try too hard for fear of

damaging it. And anyway my working ST doesn't have any square chips or
sockets like the one into which the expansion plugs, so I couldn't test
it there either.

So, that's all there is for now. :-)

SoLo2 of the BITS presents...

"BoUnCinG BLObS"

intro #30

It shows a first approach to
"moire" plasma, idea copied
from some ZXSpectrum demo.
Programmed by Byte.

Some big "blobs" bouncing,
many titilating star field objects,
an Amiga like 3D-font scroll line.
Thanks to Pixl.

Nice traditional music arranged
by Atom.

Hi,
      I have a UK Falcon for sale.

Boxed, mint condition.
60M Hard Drive
14M Falcon Wing

Not sure how much these are worth now, and would rather sell here than on e-bay.

Any offers,
                      Mike

I also registered a Wiki domain for Atari, but really hasn't gone anywhere.

http://www.atariwiki.com

Have MediaWiki setup and copied a few things from WikiPedia to it for testing. Announced up at AtariAge, but most people felt AtariAge was a repository of info anyway.

ahhh , yeah I know what your doing now, yes take out the entire board, in
fact I think you can take out the entire board and the metalwork all in one
go even before seperating the metalwork... I will update the images as they
look corrupted, might be worth making a copy of the page :)

Chris

I did not notice that, did you have a game started? I know it does not
trigger when the game is in demo mode (or displaying splash screen). Also,
try to press 'Y' a longer time.

Were running in fullscreen (xbios driver) mode?

I sometimes have crashes also. I run MiNT in both console and gem mode (Xaaes) without problems. The biggest cause of crash is audio, so you can try disabling it. Do you use the ct60 'cache 5sec' mode? I know it does not work for SDL programs, and the cache stays off.

Pretty much spot on, the majority of ram upgrades (Marpet, Evesham etc)
piggy back the video shifter and MMU.

>
> I was surprised to hear about an MMU -- based on my experience with

IIRC the 68000 doesn't have a built in MMU. It wasn't until the 68030
cam about that Motorola integrated one. It is why you cannot run virtual
memory on an Atari without a 68030 or better.

If 8 slots are full and 8 empty it will be 2 meg. Try reseating all the socketed chips. It is amazing what a little oxidization will do.

Mark

Hi,

> But yeah, we would all benefit from some good docs.

On german there is a good starting point: TOS.HYP which is a nearly complete description of the TOS API and a very good reference. Ths document is in UDO format which allows to build a HTNL version (online on my homerpage), a ST

Guide version and many other versions. We have prepared the source for multi language support. There is only left the translation of most of the text to get the english version.

> I really think it's time for an Atari everything wiki.

A wiki is nice. And if i only look for some few informations a wiki in the internet is a good thing. But i would like to have a programer document and reference as a offline version. I dont like dependencys to external sources if i had to use it very often as a reference. And i would prefer a ST Guide version for the work on my Atari. A ST Guide version is much more handy for me to use.

Regards
Michael

Hi,

>> Like what? Not something dirty in German I hope?
>
> Google translator isn't so great, but it seems to indicate it might be
> interpreted as 'graves'.

No, this is not the only association. A digger is also someonme who makes
hole in the earth to search for gold. And "to dig" is all sort of "earth work",
in german "gaben" which is also independant from graves. You can dig a
grave, but you can also dig in the garden, ...

First, you need a SLMC804, which is a scan converter, or serial to raster converter, which connects to the DMA port. It usually comes with a printer cable, which has some long-gone standard connectors.

BEST Electronics might help you with this.

Jim

Greetings,

Looking for info on all ways possible to connect Atari Computers,
such as MegaSTE and Falcon to the Internet without using a normal
Dialup account/modem.

Is there any Web Sites with info?

Seems I recall some hardware that allowed this.

Anything new in the works?

What I really need is a way to use a Cable Modem with
my Ataris.
What do I need to do this? (Hardware and Software)
Without using Mint if possible.

Thanks,
phantomm@bellsouth.net

There is the Lantronix UDS10 serial port to LAN converter. It will allow you to do telnet and ftp easily on any Atari.

There is the EtherNEC. Its basically a NIC (network card) that attaches to the cartridge port of your ST, TT or Falcon. It works with STing, and there are MINT drivers as well. With it, you can browse the web, do e-mail, newsgroups, pretty well whatever.

In the works, is the EtherNAT. True LAN connectivity for Falcon owners with a CTxx series accelerator... USB port as well.

HTHs. :)

Do you mean TOS.HYP 1.70 by Zorro (5.5.95) or TOS493.HYP which is
dated 5 Juli 2005? I guess the latter, as it's part English already.

At 1.75 MB in the HYP version it's quite a job to do the
translations :-(If you need some help, I could do a part, though
I am not too familiar with UDO (though I have V6) - normally I
work straight in the STG format, but I have done some UDOs, where
I just left the existing tags.

Both HYPs seem to be very useful, though I am not a programmer so
can't make full use of either!

Regards, /Peter/

He probably means TOS_494_hyp which dates from end february 2006

This version can be found on the chapelie

<URL:ftp://chapelie.rma.ac.be/atari/docs/tos_hyp/tos_494_hyp_en.zip>

You probably need to use a cable router as the Atari does not support
DHCP....

> What do I need to do this? (Hardware and Software)

See the above. Ethernec will work on any ST, others may need specific
hardware. (e.g. you can't use an ASCI on a Falcon)
However even on my TT surfing the web with CAB is intolerably slow compared

to a modern PC. I tend to use the network to back up the Ataris to the PC jumbo hard drive....

> Without using Mint if possible.

Yes, CAB is SLOW! But have you tried HighWire?

Well folks, I've got some bad news.

The DarkForce! BBS is down until further notice.

The Mega STe that I've been using to run the board has apparently suffered another power supply failure. Thats the 2nd one in about 4 months. I had replaced the first one with a used one off Ebay. As far as I can tell, thats the problem.

The Mega ST that I usually use is down until I get the MFP chip socketed so I can try the RSVE upgrade I've got.

So I'm left without an operational ST to run the board for now. As soon as I get enough funds saved up, I'll either get the Mega ST repaired, or get a new P/S for the Mega STe.

I'm sorry for any inconvenience... :(

Is there anything we can do to help?

Chris (Exxos) and I maybe able to repair your PSU's. Find out how much
they'd cost to ship to the UK??

Mmmm. You might be able to codge an PC ATX power supply even.

Check out the hardware section of Atari Forum, Simbo has written a
series of articles about overhauling PSU's that might help.

Hrmm..
I might have some donations I can make.  Let me check my stock.  Remind me
if I never follow up on this as I'm forgetful as you can get :-P

Thanks,
Mark

If you get stuck you can use an AT PSU.

Mark

Lyndon,
 Sorry, cut and paste overload. That was meant to go in the "Anything new
in the works?" section.
 How is it going, it looks good, when can I order some for my STE, TT and
old old Mega 2....
Dave.

p.s. any one going to do USB storage driver. would be nice if we could plug
USB lap top drive in that USB port....

Hi /Peter/

> Do you mean TOS.HYP 1.70 by Zorro (5.5.95) or TOS493.HYP which is
> dated 5 Juli 2005? I guess the latter, as it's part English already.

I mean TOS493.HYP.

> At 1.75 MB in the HYP version it's quite a job to do the
> translations :-(

Yes it is. I recompiled the hyp file to stg and then converted the source to UDO because i want to have a online version and a ST Guide version from the same text base. And it was a huge work.

> If you need some help, I could do a part, though
> I am not too familiar with UDO (though I have V6) - normally I
> work straight in the STG format, but I have done some UDOs, where
> I just left the existing tags.

Every little help is welcome :-) My english is alittle bit weak and i would prefer not to make translations of the text.

But i have to talk to Gerhard Stoll. We have placed the source in CVS which allows every one to work on it. And we had prepared the source for multi language and added a english part with the german text. So the structure is present. But Gerhard Stoll has added some english parts and i have to syn mee with Gerhard.

Regards
Michael

In this case, PMMU != MMU.

Howdy,

This years, like the past 4 years, I spent my holiday in a beautiful
country called Czech Republic.

On one of my trips I had to take a free bus who brought me from the
zoo of Vyskov to the Dinopark in Vyskov and back.

You can find a picture of that bus on

> going to do a little experimenting.

You can NOT use both setmmu and the Hades ACC simultaneously. The Hades ACC doesnt setup a good translation tree, and it modifies the PMMU too late for MiNT. Also, you need to make sure you tell setmmu how much ram you have in your Hades by chaning mmusetup.cnf. Do you get this problem with 1.16.x versions found in xaaes alpha packets on xaaes.atari.org? If so, read carefully the part about <sysdir>, and use the name "1-16-cur" for the alpha versions (because they're "current CVS" binaries).

Best Regards,
Odd Skancke

Hi Alan,

did you get the contents of the damaged disk?

If not you might want to get in touch with Application Systems Heidelberg, they still sell NVDI.

AH> Oh, it's the English version too I need.

Mine is german...

Regards,

Alexander

I am looking for a working version of BX000962.SPD Egyptian 505 roman.

Unfortunately both files I have, originating from Compo's Font Pack Gold, Disk 5, are faulty and crash Fontname and Arkus when I try to display them.

BX000961.SPD Egyptian 505 Light, BX000963.SPD Egyptian 505 Medium und BX000964.SPD Egyptian 505 Bold are OK.

Can anyone help (I suspect all English Compo versions are faulty, as my files came from two different sources). Does Bitstream still exist? If so, where?

Or is there perhaps a TTF equivalent?

Regards, /Peter/

Greetings, fellow Atarians! :)

Here are the winners for July 2006:

Final Frontier II - Almostrice wins the $75.00 prize!

ST Magazine - Pantera wins the 3 mag. sub. to ST Magazine!

Next months prize includes a free 3 mag. subscription to
ST Magazine, for some lucky Atari caller!

Congratulations to our winners, and good luck to all who
call for next months prizes. :)

```

Hi there. After using an Atari ST briefly in the mid 90's I finally got one myself last year and have been enjoying using it with Notator to control my MIDI rig. I'm living in Germany, where STs are plentiful, and I got mine for 10 Euros, which was overpriced, but there we are.

Now it happens that I've decided to move back to the States, and since STs are much harder to find in the U.S. and much more expensive I'm considering bringing mine with me, only I've realized with some dismay that the bottom of my STf says "220-240V 50Hz" which as we know is not gonna cut it in the States without some expensive converter which I'd rather avoid.

So the question is: Did any STs come with universal power supplies? If I'm going to bother bringing an ST across the Atlantic I figure it may as well be a Mega STE, since that's the latest and greatest that'll run Notator AFAIK, but I only want to bother with that if I can be relatively sure that it'll work on U.S. power.

If there were none with universal power supplies, then I imagine getting a U.S. power supply would be just as difficult/expensive as getting the whole machine once I'm back, in which case I'd forget about trying to ship it from here and just get it there. What do you think?

Anyone else have experience bringing STs from Germany to the States? There seems to be some demand in the U.S., and a ridiculous supply in Germany.

Thanks for any help or suggestions.

P.S: Nice group you have here! I've enjoyed reading over the posts of the last half year.

Hmm, it seems to me, you've got a couple of options, as far as the P/S goes.

You can replace the P/S with a US one, Best Electronics sells them for about $115.00, last time I checked.

You could try to get a used one from Ebay. I did this just recently, picking up one for my Mega STe for $36.00, and it worked fine.

There's probably another option as well. You can use a cheap ATX power supply to run STs. I did this with my Falcon for awhile, until I got my CT60 accelerator (which the ATX P/S plugs straight into). It does require a little rewiring, but works. I'm not sure if you could find one of those micro units that would cosmetically match up to the Mega STe and fit inside without some "engineering" though.

I have a Mega STE with 4MB RAM.

When powering up the screen at certain verical positions has sparkly effects as though the RAM was bad - but it's not.....

The memory tests are fine, and I've swapped them as well with the same problem.

The sparkle effect tends to disappear after a few minutes of warm up though.

Anyone any ideas what could cause this ?

Thanks,

Alan.

Anyone know the specs for the keyboard fuse at F31 on the MegaSTE.

Seems as though I just plugged in my QwertyX and it's popped. Ugh.

Alan.

Alan, just a thought - but do you have a 2nd monitor to try, just in case
its the monitor and not the Mega STe itself? Or a 2nd ST to try with that
monitor? Would rule out that possibility anyways...

I use the monitor everyday with my TT and Falcon, so I know it's not the monitor.

Alan.

Could you try to play some MOD-Files in STEREO on your MSTE (perhaps with Paula or some similar programs)?

If you hear crackling sound your MSTE is one of a few machines with a bad GST-MCU/GLUE. In this case all you can do is to change this chip (C300589-001 U501).

I once had a MSTE like that and I also had the impression that after a few minutes after warmup it disappeared but the crackling sound still remained.

Regards,

Frank

I don't think there were any universal PSs, but a small auto-transformer 220-120V should do you. Not expensive The

difference in frequency should not matter, as Ataris use
switch-mode PSs.

Alternatively, you should be able to buy a 120V power supply board
from Best Electronicsof San Jose - see www.best-electronics-ca.com
or email Brad Coda at bestelec@sbcglobal.net

I haven't really paid much attention to the Atari Megas before (having used a 1040 STf) but now that I'm looking for a Mega STE I'm seeing two different keyboards depicted:

One that looks like this, with diagonal function keys and which bears a good resemblance to a 1040 STf and looks pretty neat:

http://mpc.fab.free.fr/atari/atari16-32/photo16-32/megalateral.jpg

And one that looks like this, with square function keys and IMHO an altogether more boring appearance:

http://www.betuwe.net/~mellemab/homecomputers/images/atari/Atari_Mega_STE_Large.jpg

Do each of these keyboards fit with a specific Mega, or will either keyboard work with either Mega? Is there an advantage to one or the other keyboard? (Or are there more models that I haven't found yet?) I read somewhere that one keyboard model was to be vastly preferred, but I couldn't figure out which one was meant. Going on visual appearance alone, I'd be strongly inclined to prefer the exciting diagonal function keys, but if there are other considerations, I'd love to learn about them.

According to my MegaSTe schematic, it's 0.5A. Don't know if it's slow-blow or quick-blow. Better get a couple in case your Qwertyx is shorting ...

Roger

The keyboards are interchangeable. The boring one as you say is for the Mega STe and the ST style one is for the Mega ST. I used a Mega ST keyboard with my falcon for a stint and now I use it on my Mega STe.

The Mega STe/TT keyboard kind of sucks in my opinion. The stupid mylar is always breaking on it. I have 8 mylars that are all trash in one way or

another despite repeated repair attempts. The Mega ST keyboard tends to
work better but can also get flaky. The Mega STe/TT keyboard has a
fairlytypical keyboard feel. The Mega ST keyboard has a rather unique
feeling that the keys press very softly with little resistance and give a
satisfying clunk as they hit the limits... Total opposite of the 520/1040
keyboards. I hate those awful spongy things.

HTH,
Mark

What Mark said. I have examples of both, and guess what? Some keys on
one of my TT keyboards dont work... bad mylar. Some people will tell
you that the TT keyboard is better than the MegaST's keyboard. Don't
believe em. Open up both keyboards and you'll soon see which one is
superior, and why.

That's really cool. While on holiday in Crete this year, I spotted a computer/electricals shop that still had a big blue 'Commodore' banner across the bottom of the window. It ALSO had a 'Philips CD-i' logo there too. How many years old are these! I have a photo of it somewhere...

Hello everyone....I have a Falcon that is a German model. When I opened it up to take a look inside I found it has a small black plastic box inside with writing on the top of it " Skunk Falcon Accelerator Rev. 1.3" copyright Comtex - a German company. Checked in a red marker on it are Speed 32 mhz and FPU 32mhz (there is also a possiblity of 36/36 mhz). It is definetly fast but I was wondering if anyone knows where I could find more info. or possibly someone has a manual?
thanks for any help,

- doug

Ah, thanks Frank. I've googled a bit more about this and it seems the IC is
C301712-001
which is the IC that has the fault, whereas the replacement is C300588-001.

Can anyone confirm this, as I do have the C301712-001 device.

Alan.

Alan,

I had a similar issue with mine and had a stack of shifter chips to replace. My video shifter was going bad. I recall there's a bad version of the PLCC shifter and a better one. The bad one broke, the better one worked.

Thanks,
Mark

Thanks for the responses. I looked up step-up converters today and
indeed they don't look as expensive as I had thought.

However, I also asked two sellers of Mega STEs here in Germany and they
both claim it says "100-120 ~ 50/60Hz 3.0A, 200-240 ~ 50/60Hz 1.5A"
underneath, whereas my STf clearly says "220/240V~ 50Hz 0.5A". One
seller was kind enough to photograph the bottom of his. See:

http://www.ryandesign.com/tmp/mega_ste_underside.jpg

So it looks like I'm in luck! I guess I'll get me one of those Mega STEs
then. I'll let you know how it goes!

This used to work, transferring by serial port adapter from a Portfolio to
a Stacy running Flash 1.6. Now it does not.

I should be able to get a biderectional serial link between the two
machines before starting an xmodem transfer. I have had that. Now, for
unknown reasons, I can type to the Portfolio screen from the Stacy, but I
cannot type to the Stacy screen from the Portfolio.

I have checked configurations and port settings, and they all look right,
but I do not get what I expected, and nothing happens when Xmodem tries to

transfer a file.

What obvious thing am I missing?

Jim

Are you sure it's the mylars? I find the problem is usually with
the rubber cups holding the carbon brushes - these tend to break
at the bottom and then don't make proper contact. I got a replacement
set of 'TT Keys' from Best Electronics, but while these gave a
much better touch to the keys, they don't seem to last very long.

BTW, which Mega keyboard was made by Cherry and used real
microswitches? Was it the Mega 4?

Regards, /Peter/

In order to avoid opening the keyboard:

The MegaST keyboard (i.e. the one with diagonal function keys) has real switches inside, as opposed to mylar in the other one. The components were made by Cherry. Keyboard weights about 1.5kg (!), is very solidly built and can last for decades. The keys indeed have a unique feel, similar to what one experienced on better minicomputer terminals of that time, which were exorbitantly priced then, and with a quality to match the price.

Btw. I have easily repaired several mylar keyboards for PCs and calculators using a conductive marker pen (used to repair PCBs) but IMO the whole concept of having those thin and brittle metallic traces printed on flexible mylar foil is wrong and unreliable.

The main problem, TT keyboard, is a trace that runs over a hard plastic
sharp edge. It breaks there. General Cement Nickel Print or Silver Print
applied in a tiny drop, and left to dry for a week or so should work. And
then I scraped a radius on the sharp edge, put a piece of cloth tape over
it, and it has worked ever since. That being said, I would really like to

have one of those Cherry keyboards. They were nice enough that some now unknown person retrofitted Cherry switches to his keyboard.

Hi. I've an ST book that I'm looking to sell or otherwise free myself of:

"The ST Assembly Language Workshop" by Clayton Walnum

Slight oddity is that I removed the spine so the pages would stay open, so it would be ideal for anyone who made a hobby of scanning in these things.

Anyway if anyone's interested, please let me know. Otherwise I'll stick it on eBay and see what happens.

Cheers,
Trystan

Well folks, my ISP is killing me. I've got a dynamic IP address, which has been very stable for 2 years. Maybe 3 address changes in that time. Now, for some reason (techs are clueless as to why, but generally opinion is that its *my* fault), I've had multiple IP address changes in the last 3 or 4 days.

I asked about a business account, looking for a static ip address. I'm still waiting for the rep to return my call about that.

I've created an account with dyndns. I've got a perl script (ddclient) setup on my main linux box thats supposed to retrieve my ip address everytime I boot up, and every 5 mins thereafter, and update dyndns. Assuming I've got everything setup correctly.

SO if everything is working like its supposed to, everyone should be able to telnet into:

darkforce-bbs.dyndns.org

Please let me know if there are any problems.

Thanks everyone, and sorry for any inconvenience.

I dont know the TOS of dyndns, but make sure your ip has actually changed before updating... Someone had told me if you keep submitting an unchanged address, it somehow violates TOS, which may or not create connection problems for you and users.

Rory

Trystan,

I have 2 duplex scanners that I use regularly for scanning in mags and books.

Hmm, I've already got the book, but since you already have the spine removed, I could scan it in for you and email the pdf to you. I really dislike having to unbind a book in which I would want to keep.

Only drawback is that I'm in the US. Might want to find somebody local

Rory

Yes, dyndns mentions that - its considered "abuse". The perl script I'm
using is only supposed to send an update to dyndns if there is an actual
IP address change.

Greetings.

I need to hook up my Mega 4 ST to get some files off, but the ICD host adaptor and it's power supply have both gone dead. Does anybody have a DMA to SCSI adaptor, preferably something that doesn't require an external power supply (or else comes with such) here in Los Angeles?
I'd like to get it soon, if I can.

I remember talking to Clayton a few years back about scanning the book and putting it out on a web. He said he had no problems releasing it into the public domain. I just couldn't bring myself to wrecking the spine on my book.

Euh! I wrote this - and I take it back. It's about MagiC vs. MiNT:

>Personally, I think it is bad coding to not support our two major
>operating systems. They are not that different from eachother. (No
>offence guys)

They are quite different. I have first hand experience now, I didn't have that at the time. Clean stuff written according to Atari docs works in TOS & FreeMiNT, but sometimes not in MagiC.

Today, I see no reason why a coder should waste his/her precious coding time messing around with problems obviously related to an erroneous implementation of the OS. Maybe if someone publishes a list of pre-defined workarounds that one can simply cut & paste into the code... nah.
MagiC prevents coders from taking advantage of new features offered by the sexy (wet blond low-moral fake-boobed) beast that is XaAES/MyAES/FreeMiNT. I can't say that I've explored that path very much *yet*, but I *definitely* will, and I suggest that other people do so as well. Give Odd, Olivier and Co. a reason to continue their hard work.

Phew, that's all. Flame me.

I'm not really looking for cash to be honest. If my 'de-spined' copy
could be put to good use and scanned in for the good of the community,
that would suit me fine. I could send it over to Rory in the US, unless
someone is closer to the UK...?

Cheers,
Trystan

No need, I agree with you :)

I too would like to encourage anyone that is still coding for the
Atari, to take advantage of the work that has been put into FreeMiNT
and the available AES's. Life is for the living :))

I agree wholeheartedly with everything said here, but would like to
point out one hurdle in the way of the budding coder for FreeMiNT:
modern documention on GEM programming -- and ideally a centralised
source from where to get it. It's sometimes very hard to figure out
one's way around GEM, and 15-years-old programming tutorials do not
seem to cut it anymore.

Hope I don't sound too harsh on the people still involved. I understand
writing programming docs is a pain.

Cheers,
JFL

Hello,

Following the Doom 0.53 release, here is the Heretic one, with same improvements:

- Fixed crash in audio on exit.
- Unrolled 4x rendering loops, a bit faster.
- Tried to make 060 friendly asm rendering routines.

Note about teamtap stuff: I found people to test it, so it's ok now.

Hexen should come soon, I copy/pasted code too fast, and it crashes :-).

New release looks great so far on my Falcon/CT60, running
FreeMiNT/XaAES.

Just one thing: When I hit F7 to quit the game, pressing "Y" (for
"yes", to confirm) will not trigger the game to quit. Other than that I
have not noticed any problems at all.

Thanks for you work.

Regards,

/Joakim

Sigh. I am feeling incompetent. I have had an Atari STf sitting on my desk with the top case and keyboard off for days and I can't for the life of me get the blasted RF shield off. I've tried and tried. The back left corner, next to the power supply, is just stuck somehow and won't move more than about 2mm, no matter how badly I injure my fingers trying. Is this common? The other sides and corners were no problem. Is there some trick to removing the shield? Or is mine just being stubborn? Admittedly I don't have any good reason to need to look inside, but I'd like to see how it compares to the other (non-working) STf I have sitting on the floor. In can already see the logic board revisions are different. The floor Atari was no problem to open, incidentally, because it had no RF shield. (I guess I'm assuming here the shield is for RF purposes.)

Did you remove the power supply and make sure all the little bend-over
tabs are straightened out? (the tabs and their locations vary from model

to model).

LS

There is a new version of TT-Digger available on my home page (see sig)

Changes:

. Machines:
Implementation of MC68020 & MC68851
Machine menu choices are now complete and behave like radio buttons.
68020 is special, because it is the only machine that can be combined with a 68851.

. Configuration:
Completely changed and massively improved.
The improvements justified the choice of not trying to keep

compatability with pre 7 config files.
It is now very easy to recreate configurations.
So remove any existing configuration files from your system.

If you have FILE= entries in .IDX files, use a editor for
removing those entries keeping the other sections alive.

TTD has been completed with a configuration window dialogue.
No need anymore for handcrafting the configuration-file.

Configuration is also localized.
A local configuration covers everything configurable.
The local configuration is saved for each object open at
close down or at each closed object in the .IDX file, or
separate in the .IDF file when 'sidf' option is active.

Please read the updated hypertext for all the details.

.   Supported formats:
The DRI format produced by the GFA compiler is now supported.
It uses a shorter form of relocation information.

.   Some bugfixes

Have fun!

```

PMDoom 0.53 crashes under MiNT for me but runs fine under TOS.  CT60
falcon.  I'll try again under MiNT, maybe it was a fluke.

Thanks,
Mark

Thank you! The shield goes under the PSU! That's good to know. I got the
PSU and shield removed now.

I had tried to remove the PSU before, but there was so little room to
maneuver it and it was unclear whether the PSU was meant to be removed
before the shield or the other way around. Now I know!

I'd like to see a 68060 version for Falcon + CT. ;-)

Thanks

Actually, looking at the posts times, I believe somebody else beat me to
this answer, so whoever it was gets full credit first. :)

I'm glad you got it sorted out though. Maybe you can take the parts from
both the non-working STs you have and make a working one? Hate to see any
STs go to waste...

Hi Rodolphe

Rodolphe Czuba wrote:

> I'd like to see a 68060 version for Falcon + CT. ;-)
>

It should run on any past, present or future M68K
GEM computer.

I have tested it on Milan040 and MAC-Aranym.

The 68060 special instructions are decoded purely
from reading the manuals. I have no 68060 hardware.

If TT-Digger doesnt properly disassemble the CT60
ROM's, please let me know. With adaquate description
of the problems.

Hi Henk!

Nice! Thanks for the continuous support!

BTW: in:
http://members.chello.nl/h.robbers/TTDIGGER.TXT

There is a point:
=F9 Output adaptable to different assemblers (GST, HISOFT, GFA, MCC,
MAS,
     PASM, DevPac etc.).

I know one can set the output the output format quite nicely. But it
would be great if there were some sort of presets of the output formats
you mentioned: DevPac, PASM, GFA, HISOFT... etc. Perhaps an extension
of the 'Look' menu or something like that?

Just an idea.

STanda

I have 5 or 6 in the shed I have repaired after they had been junked by
friends. Even picked up a Falcon for $50 aussie that jest needed a few
tracks repaired. It pains the wife tho.

Mark

A nice idee, but I really only know PASM, thats why I leave
it to the user. ;-)

However, I could let the user record a chosen set of directives
under a name.

Perhaps next version.

Hello!

[configurable assembler output formatting]

HR> A nice idee, but I really only know PASM, thats why I leave it to the
HR> user. ;-)

I guess that some users already have customised the output to fit their
preferred assembler, so why not let them contribute their configurations
to the (TT-)Digger distribution?

I never tried TT-Digger, so maybe my proposal is not applicable due to the way the output format is configurable.

Regards,

Alexander

You have to know the code inside and out in order to document, the only people that really fit the bill are the people who wrote it. The people who wrote it are either gone or still writing for it. The people who are writing for it have so little time that time is best spent coding, therefore nobody is left to do the docs :-P Almost a paradox.

But yeah, we would all benefit from some good docs. I really think it's time for an Atari everything wiki. I'll be setting one up later today.

Thanks,
Mark

How about, something like this:

Code-Digger

Bit-Digger (or Byte-Digger)

Or something all together new like

Bit Nibble

or

Nibble Bit

The possibilites are endless. :)

Hello Marc!

MD> But yeah, we would all benefit from some good docs. I really think
MD> it's time for an Atari everything wiki. I'll be setting one up later
MD> today.

The point is that there must be some *central* and *well known* place
where *all* (available) information is gathered. Right now there are many
sites that come up with bits of information and few that try to offer
"everything", but they fail due to missing acceptance (I think).

Regards,

Alexander

I always get, "why do you need a new Guitar", "why do you need another
Atari........"

Actually she is quite supportive of the Hifi and Guitar thing. But I
have to think she may be right in regards to ST's. It may be time for an
ebay spree.

Mark

OH MY GOD! Where have you BEEN ALL MY LIFE!?!?!?

See folks, for those that don't build RPMs, you wouldn't know my nightmare. You see, building RPM's the build has to go from start to finish perfectly. Any interruption results in you having to restart. This is fine for small packages but this gets to be VERY tiresome when attempting to build big packages with RPM and correcting errors.

Also this REALLY hurts for building GCC.

Our falcons are slowwwwwww, even with the CT60 with gcc... It just sucks.

And then there was ccache! I got it built tonight. It required some memory management code modifications but it builds and runs great now. I'll build an RPM for you guys wednesday night.

Basically it makes a hash of the C file and can figure out what files it needs to build on a make clean and which it don't. It caches the compiler output. If you compile something once. It takes the normal amount of time. Compile it twice. It happens VERY FAST. Now you can get the benefit of make clean && make without the pain of waiting.

Check it out. The first iteration with ccache running:

```
root@washi:/root/ccache-2.4>time make
gcc -g -O2 -Wall -W -I.   -c -o ccache.o ccache.c
gcc -g -O2 -Wall -W -I.   -c -o mdfour.o mdfour.c
gcc -g -O2 -Wall -W -I.   -c -o hash.o hash.c
gcc -g -O2 -Wall -W -I.   -c -o execute.o execute.c
gcc -g -O2 -Wall -W -I.   -c -o util.o util.c
gcc -g -O2 -Wall -W -I.   -c -o args.o args.c
gcc -g -O2 -Wall -W -I.   -c -o stats.o stats.c
gcc -g -O2 -Wall -W -I.   -c -o cleanup.o cleanup.c
gcc -g -O2 -Wall -W -I.   -c -o snprintf.o snprintf.c
gcc -g -O2 -Wall -W -I.   -c -o unify.o unify.c
unify.c: In function `unify_hash':
unify.c:245: warning: unused variable `c'
gcc -g -O2 -Wall -W -I. -o ccache ccache.o mdfour.o hash.o execute.o util.o args.o
stats.o cleanup.o snprintf.o unify.o

real    0m42.100s
user    0m29.250s
sys     0m9.730s
```

Now ccache cached this build:

```
root@washi:/root/ccache-2.4>time make
gcc -g -O2 -Wall -W -I.   -c -o ccache.o ccache.c
gcc -g -O2 -Wall -W -I.   -c -o mdfour.o mdfour.c
gcc -g -O2 -Wall -W -I.   -c -o hash.o hash.c
gcc -g -O2 -Wall -W -I.   -c -o execute.o execute.c
gcc -g -O2 -Wall -W -I.   -c -o util.o util.c
gcc -g -O2 -Wall -W -I.   -c -o args.o args.c
gcc -g -O2 -Wall -W -I.   -c -o stats.o stats.c
gcc -g -O2 -Wall -W -I.   -c -o cleanup.o cleanup.c
gcc -g -O2 -Wall -W -I.   -c -o snprintf.o snprintf.c
gcc -g -O2 -Wall -W -I.   -c -o unify.o unify.c
unify.c: In function `unify_hash':
unify.c:245: warning: unused variable `c'
gcc -g -O2 -Wall -W -I. -o ccache ccache.o mdfour.o hash.o execute.o util.o args.o
stats.o cleanup.o snprintf.o unify.o

real    0m9.525s
user    0m3.890s
sys     0m4.620s
```

LOL. Look at that difference. This is a MAJOR boon to atari developers using freemint! I'll get it packaged ASAP but it will take a couple days since I'll be travelling.

PS: it's just amazing to look at the files fly by, 2-3 per second, not even bothering to build!

Thanks,
Mark

Well yeah, that's what I mean. I'll try to make it the end all be all
wiki. Maybe give it wiki.atari.org :-P

Thanks,
Mark

The tool only caches output.  more of a workaround :-P

And yeah, this isn't a crack about the falcon so much as the situation
we're in and a way to handle it better.

Thanks,
Mark

Hello Lonny!

I should have read further before answering...

l> Google translator isn't so great, but it seems to indicate it might be
l> interpreted as 'graves'.

Right, that's the direction. To dig translates as "graben", which I
somehow associate with making holes for the dead. Kind of "Grave Digger".

Maybe I'm strange myself ;-)

You and Henk should forget about my concerns...

Regards,

Alexander

PS: A good online source for english <-> german translations is
<http://dict.leo.org>!

Hello Lonny!

l> Why not just contribute to this one? Seems to have a good start.
l> http://wikipendium.free.fr
l>
l> There is also one at
l> http://www.atari-forum.com/wiki/index.php/Main_Page

That's exactly what I wanted to say. There are promising approaches
already. The point is to concentrate them to one central source with all

information, linked to or mirrored by all former sources.

But I guess it's not easy to make all admins of the "distributed" sources agree on one main URL, one common underlying system and layout. Althouh the last could be adapted - if not user-configurable on the central source then at least for each mirror - for different tastes.

Regards,

Alexander

Mailed him last night, are you ready for this....

"
Yes, price is 8 GBP per female set (plug and enclosure), and 10 GBP per male."

That's simply ridiculous. It's like saying that you can have a loaf of bread for �10!

:-)

This guy btw; bitrom(369)

These people are getting the thumbs up so far although their P+P is still high at $65!!!

Mmmm, maybe I should start doing this with PeST, yes that'll be $65 (or $120) postage please.

Random comment. I complained about one of those TeX drivers not working,
and someone reminded me of the Lindner distribution, which has useful
drivers for other distributions. I think I saw that distribution on some
unrelated CD, possibly N_AES.

That might be worth a look.

Jim

Version 3.84 of TeraDesk open-source desktop is available at:

http://solair.eunet.yu/~vdjole/teradesk.htm

Two not very important bugs were fixed and several small optimisations were made.

See the history file for more information.

Have fun.

Thank you for your work on Teradesk, and support. I noticeably
remarked that resources from EB_Model 3 had a better aspect now.
So I can thanks from Emmanuel Baranger who worried about it
(not much, it's rather 'cosmetic'). Teradesk is very seriously
maintained, and because I use it exclusively, I really care.

I wish you fun coding further.

Best regards,

Yes, just once, but I really had not finished the setup. I just wanted to see how I stood. I really was not trying to get it to load. I was more interested in loading Mint 1.161. I paid the price though. My fat tables got messed up. Luckily I had backups.

No, I'm not quiting. I just don't have room to set up both my ST and Falcon and would prefere to make more use of my Falcon, espicially as I can use it test STOS programs in all 3 ST resolutions and STOS 3D runs at a decent speed. Rather annoyingly I had just finished copying the backup floppies from my ST's HD to the Falcon yesterday when when it died on me :-(

Aint it always the case!

Does STOS 3D work on the Falcon ? I can't even remember, I know it sure
don't like CT60 as I had to disable the extension to allow STOS to boot up.
I though that it didn't even work on a Stock Falcon...

STOS 3D runs fine on my Falcon, its a stock 4Mb Falcon with TOS 4.02. The only original STOS extension which does not appear to work is the Meastro extension, it does not record from the sampling cart for some reason.

Steve

Hello all,

My NVDI 5 (disk 1) is corrupt. Disk 2 is fine though.

Can anyone help me out to get disk 1 again ??

Thanks,

Alan.

Yes and no. I think it was CNF files mainly because I now have a working
Mint/XaAES system after I used the newer Easymint 1.6.

Hello all,

I am having trouble running the SetMMU program (takes the place of the Hades
accessary program) and Mint. It seems if I try and run it in the boot process,
Mint reports that it cannot load my Mint.CNF file. If I do not run it, then
Mint loads fine. Has any other Hades owner had theis problem? I am thinking it
is the position of the program in the auto folder that is the culprit, so I am

going to do a little experimenting.

Hello,

Thanks to Marc-Anton and Easymint 1.6, I now have a good working Mint/XaAES system. Now I understand what the talk was about XaAES. It is MUCH better then N.AES. Jinnee loads in fine and looks great in 24 bit. No problem with the color of the icons. I just have to boot Jinnee up in the booting process and not load it in after Mint/XaAES has booted.

The best part is, and I never thought it would ever be possible, is that I can now change resolution and/or color modes without re-booting. All I have left is to solve the SetMMU thing, setup my paths and add some programs to boot. Then I will use this as my main system.

Wish you luck with the Nemesis installation.
It isn't hard to install.
I did have a bad experience with mine. It was the 25/50
version and the buffer part worked, However the main board
did not. And it was bought brand new.
After looking back over the manual and updates, I think a big
part of the problem was due to removing two capacitors on the
Nemesis board which was suggested by a last minute addition to
the manual. It even had a picture!

It would probably work if I install the caps. but I moved on
to a Centurbo 2 B version. Liked it so much that I got another one
and is fast enough for what I do.

If you get the Nemesis working correctly 640x480 in TC mode is
possible.
The CT2B does this easily, even 800x608 in TC. I really haven't
tried to push it any farther than that in TC mode.

BTW, if you get it working e-mail me.
I'd also like to know which version you have.

Good luck,

phantomm@bellsouth.net

Years ago, I recall a program called Mountain.
I think it was from a French programmer.

I think it was a multi-media type program and
may have support for some digitisers or cameras.

Is this program still available?

If not, anyone have the last version registered for
sale or trade?

Contact me at:\
phantomm@bellsouth.net

CNF can be responsible for non working application, hardly for HDD crash. FAT tables are messed up if computer crashes while accesing them, etc. The only reason that MiNT may be responsible is that user mke2fs wrong (already used) partition... Iwe done that already :) Anyway, MiNT is not some fearfull application which at littlest mistake wipe HDD. I messed up CNF a lot of times (while changing them to fit all, even AES and desktop app, and tools to mint partition in /aes folder. That way no matter on what partiton i have MiNT, i only need to change sln link in mint.cnf, and all works, since all cnf files (aes and thing ones) use U:nified paths (naes path is

not c:\n_aes but u:\aes\n_aes or /aes/n_aes and so on, so its not drive
dependant) and really got me in troubles sometimes, but didnt lost HDD
content..

Janez

looking at the web page (author R�my Vanel) at
http://vanel.club.fr/index.html,
you'll see that the lastest news are from 2000 and that in 2001 Mountain
became free.
You'll find the link to download it.

(an union jack flag is present to have the pages in english).

Guillaume.

Is the megafile.atari.st website still alive? All I know is that I cannot
get to it from here, which is in the area of Michigan and northern Ohio.
It times out a browser.

Jim

Hi all,

Just managed to get my Eiffel interface working, and am testing a wireless keyboard/mouse. This seems to work pretty good, but there are a couple of hickups.

The main problem is that the mouse sensitivity is way too high, the mouse pointer is moved across the screen very fast even with small mouse movements. Does anybody know of a configuration program that will allow me to reduce mouse sensitivity? Silkmouse looked promising, but it would only allow me to *increase* the sensitivity.

Any ideas?

Regards,

/Joakim

Take a look at :

http://search.ebay.com/
_W0QQsassZpanamajoe2005QQhtZ-1QQfrppZ50QQfsopZ1QQfsooZ1QQrdZ0?

I have :

- The Pawn
- The Guild of Thieves
- Jinxter
- Fish
- Beyond Zork
- Spellbreaker
- Times of Lore
- Demon's Winter by SSI
- Phantasie II and Phantasie III
- Questron II
- Stunt Car Racer
- Magic Pockets by the Bitmap Brothers
- Xenon 2 by the Bitmap Brothers
- Captive

- Legend
- Rubicon
- Obsession for STE
- Wolfchild
- Populous II
- Elvira

and many more games.

I didn't list all my games on ebay, if you are looking for
a game, please ask, I have many more.

You might check out CKBD 1.5. It seems pretty complete. Don't know if it
will slow the mouse down, though.

Thanks for the tip! It actually seems to be able to slow it down too,
although I have not
figured out exactly how to fine tune things. But now I am at least able
to use the wireless mouse :) Cheers!

Regards,

/Joakim

I have PC speed for the ST and Falcon Speed. Also Ram Gizmo for Falcon number 2. A few Plug in expansions like the Happy cartridge, Romantic Robot, Supermon for the 800XL (anyone have a spare pokey;-) probably more I can't think of atm. Seriously wife agrivating tho I don't know why;-).

CT2 Falcon
Falcon030
TT030/2 w TTM195
MegaSte4
1040STe (4mb & TOS 1.62/2.06)
520STM
5 520/1040 STFM's
800XL (256K, SIO2PC and Supermon)
130XE
800XL
600XL (64k, Chroma-luma)
XEGS
Jaguar
Portfolio
Lynx II
2600 Junior
2600 Darth Vader

Also some bits that need restoring another 130XE and MegaSTE. And 2 MegaST's. A few weird monitors as well. Ah blessed is Atari and all those that worship at its temple;-)

Mark

What is the deal with that? Do you have a pic?

My TT030 was one I originally drooled over at Mouseworks here in
Melbourne. I bought it from a friend who had acquired it a couple of
years ago. Damn its fast;-)

> These two ones were meant to only run games and demos, so most work has been put to accurately emulate the ST hardware. There are some enhancement, like running the emulated 68000 at a higher frequency, useful for people still developping ST software.

About Pacifist I used some time ago, it's a great emulator when your host is an old machine with no much power. I installed it on a 486DX/50 with 4Mb. It was a notebook, so I had a kind of "Stacy" I could travel with, bring it to work, etc...

Close to 3Mb of ST Ram, enhanced graphic modes (the best was 640x480xmonochrom), and with NVDI I was close to the speed of a Mega STE without NVDI.

You could run color applications (640x480x16) but with a jerky screen and slow reactions from the computer. In monochrom, it was great, (Everest, Assemble, GFA Basic, Interface, etc...). I didn't use it for games.

I have never tried to run PCDitto under Pacifist!

That was my experience.

Guillaume.

About Aranym,

I would say that, it's more a TOS+GEM emulator rather than an Atari emulator. I mean that you can't run a "dirty" program (as many of mine!) that makes direct access to the hadware. But you may run the others that use standard and documented calls to BIOS, VDI, AES? etc...
Finaly, slow programs on Atari that used to respect everything are speed up under Aranym. Fast programs on ATari that used to take advantage of every easy way of hardware just won't run.

I could say that Aranym is a booster for bad programs, but I won't!
I didn't say it!
No no no, I didn't! It was just a joke!

Guillaume.

You're misinformed. I maintain the MacOSX version of ARAnyM building
snapshots that are located at <http://eureka.atari.org/MacAranym.zip>
and building official releases. And also maintaining a boot disk image
from which the Pack_3D derivate, that is located at :

<http://eureka.atari.org/xa-my-aes.zip>

At this title, I built the OSX and Linux binaries for the Pack_3D,
and gave a great hand to Emmanuel to build his diskless configuration,
notably obtaining the way to configure the internet from you J-F.

Don't you know that ? Did you forgot ?

>> Since the release of ARAnyM, I have been interested in the philsophy o=
f a
>> "virtual machine" as opposed to an "emulator". Could you explain the

> emulators that were trying to emulate an original Atari computer as
> close as possible. ARAnyM is more like an Afterburner040 emulator,
> whithout some Falcon stuff.=20

I suggest you to extensively discuss with Petr, what I have done
since all these years on the ARAnyM mailing list, to understand his
attachment to this 'virtual machine' concept. If you carefully read
the home page of ARAnyM, you will see :

"
ARAnyM is an acronym: Atari Running on Any Machine. It is a *virtual=20
machine* software for running the Atari ST/TT/Falcon operating systems=20
(TOS, FreeMiNT, MagiC and others) and TOS/GEM applications on any kind=20
of hardware - be it an IBM clone (read it as "PC" :-), an Apple, an Unix =

server, a graphics workstation or even a portable computer.
"

I have not much to add about the reliability of your arguments :(

Regards,

BGru> Howabout this question:
BGru>
BGru> Are there any that support any useable connection through STinG?

ARAnyM supports networking, though I don't know wether STinG would work.

BGru> I was hoping to be able to use a bridged TCP/IP subsystem much in
BGru> the same way that VMWare does, but no avail.

See ARAnyM -> AraBridge. Not easy to configure from what I read, but I did
not try it myself yet.

Regards,

Alexander

I could snap a pic of it, but really, it just looks like any other Mega
STe keyboard. It just so happens that I bought it off Dave, and I'll keep
it always, just for sentimental reasons. He was selling a bunch of
stuff one time on Ebay. Toad Computers was one of *the* places for me back
when Atari was still around. :)

I had a TT once. They are very quick. Nice machines, through and through.
Have you had the chance to see a CT60 equipped Falcon boot up yet? :)

Hello,

Just a small fix this time, related to the GEM mouse cursor management.
The cursor also revert to an arrow when outside of the application window.

Available on my site as usual.

I still have an old catalog around somewhere I think.

Also I have the original spec documentation for the ST from 1984. All
labeled top secret etc, etc. That I'm keeping;-)

My CT2 woops the TT, but even that is rare in Australia. Probably never
see a real CT60 though I think Austin has one out in western Victoria:-(

Hi Joe & All,

Thanks for the replies here, what on earth have I started!! ;-)

Joe, I think I need to priv-reply to you... Everyone, Joe kindly sent me a message a week or so ago and I haven't replied to. Yes I'm feeling guilty! I'm just being incredibly crap at checking (and replying) to emails at the moment, just started a new gym membership n stuff.

Anyone have any ideas on how we could bring all of these 'rare' items together? I'm thinking an SQL database somewhere with a basic (very) PHP front end. No graphics or anything, just the ability for people to blindly submit what they have in text form. Could be one of our greatest combined projects... Not talking any registration or any of that rubbish, just the ability for people in their moment of enthusiasm to enter what they have into it.

Views? Anyone have a server out there with SQL and PHP on it?

Aly x

Any enquires or anything please direct to atariATlogicsays.com .

I have bits coming into about four different addresses at the moment. Not that I'm that popular but I like to reply when someone has mailed.

Thanks,

Alison

Yes,

And something like that could easily be included into a massive Atari
16/32 wiki.

Thanks,
Mark

Well not emulator is perfect. The best one will run just about everything and at the same speed on the original ST. The best one for Windows that I have found is STeeM. This one still needs an original ST to save out files that will later be ran on the PC. I was surprised that I was able to run copy protected games/programs.

Geez, you were able to get X running on the TT using Debian Linux? What version of Linux are you running. I have the Sarge version and cannot get X running yet. I also am using Mint and trying to get version 1.16/XaAES to run right now. Which one do I prefer? Right now it is Mint, but I am not going to give up on Linux. I would keep both.

I have not seen one, but I would think items that first came out when the ST came to light in 1985 would top that list.

Then I think items that were produced towards the end of Atari's life and so
were not produced in big numbers.
I guiess even the TT is rare. Not seen one on Ebay for some time  now...

```

Version 3.83 of TeraDesk open-source desktop is available at:

http://solair.eunet.yu/~vdjole/teradesk.htm

This is a bug-fix and code-optimisation routine. Several bugs, including a bad redraw and message-handling problem that manifested only in Magic-PC were fixed. Functionality of some features was improved and a number of simplifications were made in the code so that program size is now less than it was in V3.80. Also, the hypertext manual was updated.

See the history file for more information.

Have fun.

Just curious....over the past few months, I have received e-mails from a few members of our A-ONE e-mail subscription list stating that they hadn't received a particular issue. A-ONE is sent out every week, on Friday evenings. Since I only hear from a few, I usually assume that the problem is on their end, not ours. However, I have noticed that in the last couple of months, I have not received the mailing either (I include myself as a test). So, I'm wondering if this is more widespread than I had imagined.

If you are a weekly subscriber to the A-ONE mailing list, and have not been receiving our issues on a weekly basis, I'd like to know. This week's issue didn't make it to me, so if you also did not receive it, I'd appreciate hearing from you. If you did receive it, I'd like to know that also! Rather than cluttering up c.s.a.s., please let me know via e-mail at dpj (at) atarinews.org. Thanks!

-Dana @ A-ONE

Hi,

The <http://eureka.atari.org/xa-my-aes.zip> boot disk image
for ARAnyM 0.9.3 is updated according to released contents.

- Teradesk 3.83 the GEM desktop.
- EB_Dump 0.9.7 the GFA screenshot accessory.
- freeMiNT/XaAES the system's snapshot from 2006/01/29.

<http://eureka.atari.org/MacAranym.zip> for MacOSX.3.9
(or better) is also kept up to date corresponding to
the disk image. It is a ready to start package that runs
on PPC/OSX machines (G4 or above).

Have fun !

Hi all,

As usual NAS was was a nice event! Amongst the attenders there were (apart from myself) ;) Ozk, PeP, MRF and a number of other local Atari ppl, Knezzen and Nick Harlow of 16/32 systems. As XaAES has started to look like a fullworthy replacement for the Atari AES, it was only natural that the main focus during NAS2006 was aimed towards Ozk and his work. Ozk himself was treated with a 68000-machine with a SCSI-disk attached, in order to provide a useful testing setup. A number of bugs that for quite some time have prevented the FreeMiNT kernel from running on 68000-setups was found and killed. There are still some things that needs to be fixed before it will be commited to CVS though, so please be patient. Apart from this, it was of course very nice to see Nick of 16/32 Systems again! He brought some hard- and software with him and was a very appreciated guest at NAS!

See pictures from NAS2006 here: http://nas.atari.org
The official NAS/SAK website: http://www.sak.nu
More about XaAES: http://xaaes.atariforge.net

Regards,

/Joakim

I've never had a chance to go, and probably, more than likely, (sadly!)
never will get to go - so I just wanted to let you know that I for one,
surely do appreciate the pictures and updates... :)

Does it already work in B&W? Much depends on whether the printer is
still backward-compatible with the level of PCL that NVDI provides.
Make sure that you've got the latest(!) version of NVDI from the web
site.

As for colour, I think you're on a losing wicket I'm afraid!

Anybody got any excess gear they want to part with? I'm interested in
pretty much anything SGI/SUN/Unix/Amiga/Commodore/Atari/Server/Video
Game/Weird/Classic/Retro/ETC that you don't wan't in the Puget Sound
area that you'd prefer not to toss out. Can't pay you but I'll give it
a good home and it won't end up on Ebay.

Hello,

Here is a new release with some fixes and improvements:
- Fixed low detail routine for networked player sprites.
- Fixed crash in audio on exit.
- Unrolled 4x rendering loops, a bit faster.
- Tried to make 060 friendly asm rendering routines.

Yep, it seems asm routines I wrote for rendering were not optimal for 060 cpus, so I rewrote them in part, with nice advices from Mikael Kalms and ray/tscc. I think that they could be improved a bit more, but I don't have time for that, as both Heretic and Hexen still have the C renderer routines.

I also rewrote the joypad support for SDL to support Jaguar teamtap adapters on STE/Falcon, but I need owner of this hardware to test it. Contact me if you have some.

The printer doesn't respond to the PCL driver that gets installed for
my venerable DeskJet 500. I have tried a couple of the other listed HP
enties without success.

Ok, let's try starting this thread afresh, since it got off on the
wrong foot:

-Aranym(multiplatform): Well, 'nuff said by others
-Steem Engine (window$/linux): The most usable atari st emulator. Very
complete and precise emulation of the ST/E hardware. Supports virtual
hard drives, so it can be used for most apps.
-SainT (window$): Another good emulator, but not as complete as steem.
WinSTon (window$): develompment stopped. Looked nice though
-Hatari (multiplatform): WinSTon with UAE 68000 emulation. Lagging a
bit from steem and saint, it is nevertheless interesting.

There are also others as you already know (StonX, TOSbox, STEmulator,
FaST, Pacifist, Echo, Gemulator), but development for those has

stopped for a long time now.

hth,

DESKJET500 is not a laser printer. I think it doesn't even understand
the postscript commands.
I successfully use that dj500 driver for every deskjet HP printer I had
(and have) but NO laserjet printers.
hope this helps

Hello Edward,

The last few weeks you've send me some e-mails. The replies send to your mail account bounced back however. It seems the mailservers of my ISP are blocked.

I did make a request to put the servers back on the list.
They have removed one server but alas it seems I'm not using the same mailserver all the time. My next reply bounced back again as I was using another mailserver as the one I used previously.

I'll send you the IP by private mail (via Paul Williamson, I hope P. W. will get throuyh).

CU

I always loved Winston, its sources were available for a while IIRC.
Oh and someone recompiled it so it ran faster, and the result was called
STEW (I think the initial idea was to carry on Winston development, but
AFAIK it stopped)

*** B I T S ***

Hello!

The BITS Club, a modern scene group programming for Atari ST, Amiga, Unix and Windows, presents You their new site in WWW:

http://thebitsclub.tripod.com/index.html

We have been using geocities.com a while, but the bandwidth/hour was not enough for so many fans! ;-)...
Anyways we still sponsor geocities at:

http://www.geocities.com/thebitsclub/

Greetings,
SoLo2

Hello,

Would anyone have a source of Dtype connectors, both male and female for the ACSI port? Hoods would be nice also. Say 5-10ea. with payment via PayPal.

There's just one company I've found that has remaining stock but with an insistance of charging me $114 postage so it's no wonder they still have stock on a 15 year old specialist product.

Thanks,

Aly

Hello, Aly!

t> Would anyone have a source of Dtype connectors, both male and female for the
t> ACSI port?

Sorry, but my former source <http://www.reichelt.de> does not list 19p
d-sub connectors any more.

The only place that I found anything alike is
<http://www.partsdata.de/Atari_und_Amiga--Zubehoer_fuer_Atari_ST_u.a.--
mechanische_Bauelemente_shop.html>.
They list female 19p d-sub connectors, both for PCB and cable mounting.
But no male ones, sorry.

So if anyone else has a (new) source...

Regards,

Alexander

I'm trying to get you to check whether the printer supports PCL5 or not
- as has been pointed out, this is a laser printer and not an inkjet.

But there is of course only one way to find out.

Give me a few days and I'll dig back through the old emails. I'd even mailed then to check that this was really true, was a US company too, they didn't care, just some telesales person answering an email. $100 odd dollars to send something weighing 100 odd grams.

Thankfully I only charge people what it costs to post items (ie. PeST), anything above that is taking the proverbial.

rant over :D

I didn't know anyone had a warehouse on the space station!
I bookmarked this along time ago. Didn't look for hoods. They state shipping
as $5.50. In the US I presume.
Good Luck.

There are still some things Gemulator is better at that STEEM. Like it has
big screen support....

As far as I can see the printer only supports PCL6 and Postscript Level 3.
NVDI only supports PCL5 which is not a sub set of, and is not compatible
with, PCL6. Can you define some kind of Apple laser printer in NVDI. I think
that might be the best bet. You may also have to
tweak the settings some where....

The Best Electronics catalogue shows 19-pin solder cup connectors (male
& female) @ $3.50 ea. and hoods @ $1.50 ea. The addendum of
13/April/2006 doesn't mention any update, so I assume they still have
them. Best Electronics are at: www.best-electronics-ca.com/.

Assuming this is a US company, I wouldn't be surprised if the shipping
was much more reasonable if it was within the US. You might well find
it worthwhile to find a trusty friend who lives within the US, have the
company ship it to them, then have them ship it to you ...

Roger

Mmmm, good prices on those BA ones, time to mail Brad me thinx.

In the UK here. Truth is it's only margainly more expensive than sending
upstate but they collar us for it royally.

All I can suggest is "keep looking". I have five males of those, thinking I would have to build an unavailable cable. They did not cost much, shipping was reasonable, and I paid either by credit card or paypal. But it was long enough ago that I do not remember where I found them.

As I recall, I typed DB-19 into Google, and looked through results until I found them.

Obviously I didn't make myself clear, but I think that David Wade has.
I mentioned the DeskJet because I believed that, if the Laser printer
is compatible with PCL 5, it should have responded in some fashion to
the DeskJet driver. That it did not led me conclude that it was not
compatible.

I have also tried some of the older laser drivers that come with NVDI
without any success.

Hello Jim>

JD> As I recall, I typed DB-19 into Google, and looked through results
JD> until I found them.

That's the trick ;-)

I tried Google - but with the wrong keywords ("19p", "sub-d", "d-sub" and such) - stupid me...

Regards,

Alexander

This email is to inform buyers of "On the Edge" that the first bonus chapter is now freely available online. This chapter fits somewhere between Chapter One and Chapter Two, right after the 6502 development and before the Commodore acquisition. The content includes the early development computers by MOS Technology (and later Commodore) and the beginning of the personal software industry. You can download the chapter from www.commodorebook.com in the bonus section.

Readers of "On the Edge" can also benefit from an exclusive 10% discount on the brand new Amiga Forever 2006. The DVD set that is part of the Premium Edition of Amiga Forever has some incredible footage from the early Amiga days. To take advantage of this offer, which applies to all editions of Amiga Forever, order from www.amigaforever.com before July 31st, 2006, and enter "AFCBM" in the Discount Coupon field of the order form.

My wife has a HP 2100 laser printer. I chose one of the HP laser drivers on the NVDI list and it worked fine, but I will admit I only printed text and not graphics. I would just keep trying the various ones out until one works.

Hi all,

We have recently been working hard to supply a thorough and accurate documentation for XaAES. Chances are that even advanced users will be unaware of certain features and shortcuts, and since XaAES has had such a tremendous development lately, chances are that new users might be interested to check it out. Hence the need for proper documentation!

The docs might seem too include details some will find trivial at times, but there is a reason for that too - by covering such information as well, the documentation can also serve as a reference for the GUI components.

Nowadays it is absolutely fair to say that XaAES despite its alpha status is a very stable and mature project, that definately has reached the original goal - to offer a free replacement for the AES in MultiTOS. Many would say that it even leaves N.AES behind.

You will find the online documentation on the XaAES website:

http://xaaes.atariforge.net/

Regards,

/Joakim

I'm one of those who states XaAES leaves N.AES behinds.
I really don't have any reason whatsoever to fall back to N.AES.
And yes despite it's alpha status it's rock solid (at least on my
setup).
Sure there are still some issues which needs to be fixed but as far I
can tell these issues are minor and doesn't affect the good working of
XaAES (latest cvs version).

> You will find the online documentation on the XaAES website:

Well done Joakim. I'm sure the docs will be a good source for both the layman and the experienced user.

Wonderful job, Joakim. The only problem with that documentation is that
it reveals those nifty new features (mainly the window context menu)
that aren't available yet to us users :-) Someone will have to release
an updated version of FreeMiNT.

You can always grab the latest version from cvs. It's not that difficult
to install a working Concurrent Version System (CVS) on your system.
See

Excellent! I am very glad to hear that there is a lot of interest in the docs! :))

Yes, that is true. The window context menu is a very recent addition and I should have made sure that I had current binary available on site before publishing the documentation. One of the main ideas with the unofficial XaAES page is to offer fairly frequent updates in binary form, so that users should not have to go through the process of installing dev tools in order to get a working product :)

I will look into uploading current binaries before I leave for a short holiday trip later this week.

Regards,

/Joakim

Ok, the binaries should be up for download now! These files are however
100% untested, but hopefully the 030 and 040 versions will be okay. the
000 kernel is known to cause problems at this time, but this is
probably going to be fixed soon.

As usual, go here to grab the file: http://xaaes.atariforge.net

Have fun :)

Regards,

/Joakim

I do have CVS installed but never bothered with compiling FreeMiNT itself. Maybe I should. It's just a bit simpler to update from a binary package.

Hi David,

LAAL>I mentioned the DeskJet because I believed that, if the Laser
LAAL>printer is compatible with PCL 5, it should have responded in some
LAAL>fashion to the DeskJet driver. That it did not led me conclude that
LAAL>it was not compatible.
right. I can confirm that by experience. I am pretty sure that no
modern (12xx, 13xx) HP laser will work on the parallel port of an
Atari.

Hi Paolo,

P>I successfully use that dj500 driver for every deskjet HP printer I
P>had (and have) but NO laserjet printers.
but I often used deskjet drivers with my (of course, old fashioned)
Laserjet 5 L.

But the 13xx series will not work with a TT at all. Trying to print
with such engine stopped (!) my TOS, until I switched to another
printer...

Sorry,

Peter

Hi Edward,

ESBJ>My wife has a HP 2100 laser printer.
That seems very interesting.

ESBJ>it worked fine, but I will admit I only printed text and not
ESBJ>graphics.
Even it did not put out graphics, I'd like to know if any program
permitting interactive output would provoke a printer's reaction.

E.g. TEMPUS editor permits to put ESC sequences into the text, or any DBase compatible soft permits to give out via the '?' (question mark) commands.

If the printer does so, at least one could give out features like bold or italics, formfeed and others...

Done. Seems to be running just fine. And I've noticed a typo in chapter '5.2.3 Context menu' of the doc:

'...perform a ctrl+alt-click...' should be 'ctrl+alt-right click'

Cheers,
JFl

July 27 will be the 10th anniversary of the Classic Computer Magazine Archive (www.atarimagazines.com). In celebration, today we're announcing that the site now offers the full text of 19 issues of ST-Log Magazine. This includes more than 600 articles and a gallery of the magazine's covers.
   http://www.atarimagazines.com/st-log/

ST-Log was devoted to Atari's 16-bit ST line of computers. It began as an insert in ANALOG Computing magazine in 1986. It spun off as a separate magazine for about three years, before being folded back into ANALOG again in 1989. ANALOG and ST-Log were sold to Larry Flynt Publishing in 1988. The Classic Computer Magazine Archive has permission to share the 19 issues published by L.F.P., from April 1988 until ST-Log ceased publication in 1989.

In addition, AtariMagazines.com recently added a cover image gallery for Compute! magazine, with a nearly complete collection of covers from 1980 through 1988. (The site offers the full text of nearly 100 issues of Compute!.)
   http://www.atarimagazines.com/compute/

The site launched July 27, 1996 as "The Digital Antic Project" with the full text of two issues of Antic magazine. The site was later renamed to The Classic Computer Magazine Archive and added articles from STart, Creative Computing, Compute II, Hi-Res, Creative Computing Video & Arcade Games Magazine, and Tandy Whiz Kids comic books.

Enjoy!

Hello all,

I've got a Nemesis installed in my Falcon, and I'm looking for the original installation manual if anyone has one, or knows where to get it - I'd appreciate it.

Thanks,

Alan.

nemesis software should be on the stos site as I put it there, I have the
manual but have no idea where it is, if you cant find it anywhere or anyone
let me know and i try and find it and scan it for the site.

if you want some advice though, dont bother, nemesis is "the falcon killer"
, IMHO its not worth the risk of damage just to make it run a few mhz
faster. Mine ran fine other than some games stopped working due to sync
problems with the screen, though after hearing about just about everyone i
know having dead falcons after a few months I soon took it and, and glad I
did... I now have a CT60 so my falcon is still alive and boosted :)

Hi all,

Have 3,000 used floppies, in about 5 boxes, separated into packs of 50. Some with games,demos, mag disks, a lot of blank formatted ones (yes I spent the time doing that) , with and without new labels, Also have a few brand new boxes of 720K floppies in packs of 50, I think theres a couple of 1.44's boxes also, normally sell these for a fiver a box,   Maybe worth posting the new boxes off, but due the amount of postage probably not worth it. If anyone wants to make me an offer then let me know. No use in posting the stuff unless you want me to, will cost a fair bit though. I am in Uttoxeter,Staffordshire (UK) if anyone is interested.

Chris

I've certainly looked everywhere. So if you have the manual and can scan it,
I'd
appreciate it.

Thanks,

Alan.

Does anyone know the definitive guide to the clockpatch for the Falcon ?

Any link anywhere ?

Well under NVDI I was able to use the printer in Papyrus Gold and Calamus SL. I was able to change the fonts, size, etc. Just no graphics. I will admit that I did not try to solve the graphics thing, so it still may have been possible.

Hey Mike. How useful is a PAL one? Can you use it with stuff
here, in the States? What about converting it? Any chance it
could be converted to NTSC some way, without too much work?

Also, does it work with the CT60 board?

Thanks! :)

For Auction (No reserve)

Falcon fitted with 14MB RAM, HD and a new NVRAM chip. The NVRAM is used
in the Falcon to store the date/time and various other boot parameters
and has a small internal battery to keep the settings. This chip had a
lifespan of around 5-10 years and when it goes, you have to re-enter
the time/date settings etc when you boot your Falcon.

This Falcon is fitted with a new NVRAM chip. It also has the clock
buffer patch, and the audio patch (see the web page link below for
details). There are no other modifications to the motherboard I'm aware
of.

I'm also including original Falcon 'Language Disk 1' and manual, NVDI 5
with manual, Diamond Edge with manual, an adapter to let you connect a
SVGA monitor to the Falcon, and an original Atari mouse.

No reserve. Thanks for looking.

I've got the Blowup Hard I device, but I can't seem to find my software for it.

Does anyone have it, or know a download location ??

Thanks,

Alan.

Hi Joseph D.!

JDP>I purchased the Falcon game "Running" from someone on eBay, but, al=
as
JDP>disk #1 is damaged.

IIRC, this game (including sources) has been relaeased as freeware
some years ago. It should be downloadable somewhere.

With best regards
Ekkehard

Having more money than sense, I am in the process of getting a hot air surface mount component removing tool, and a complete set of nozzles.

I have cut the pins off chips with a dremel tool and a cutoff wheel, and the drag on the pins pulled pads off the board.

I am not sure how anyone could use my very expensive toy, but it is (or will be when I get the nozzles) available to solve little problems like that. One of my TTs has a dead printer port, and that will be my first project.

Jim

Sorry,

Thats one Cable that I do not have enough of.
I could use a few myself.   ;)

Also, wanted everyone who sent me e-mail to
know, that I am in the process of answering your
requests.

I just got back from a small vacation and things
are abit piled up. E-Mail and etc.

Will answer asap.

Thanks for your interest.

phantomm@bellsouth.net

Hi all,

Now things are up and running at NAS2006!

We will try to pop in on #NAS2006 on ircnet whenever the machines are
not
involved in bughunting or coding ;)'

Read more on http://nas.atari.org

or the official NAS-page at http://www.sak.nu/

Regards,

/Joakim

I have lost a disk, and forgotten a program name. What is it I need,
other than a TOS image, if I want to boot an ST machine on, for example,
2.06, without modifying the hardware?

Jim

Someone wanted to know how to print index cards. I do not know for sure,
but gemvelope has .glp files for cardfile and for cardfile4, and puts
words about a merge function on the screen, implying that one can merge a
cardfile file into something about the size of a small envelope.

I would know more, but sometimes Gemvelope gets confused, and thinks I do
not have enough memory. When I get it unconfused, or if I get it
unconfused, I will know more.

Greetings everyone!

Here are the lucky, the few, the proud winners of this months prizes at
The DarkForce! BBS:

June 2006
1. Final Frontier 2 - none (game rolled over to next month)!
2. ST Magazine - Doctor Clu wins the free 3 mag. subscription!

Congratulations to our winners!

Also, here are next months prizes:

July 2006
1. Final Frontier II - one lucky winner, or *team* will win the $75.00 prize. Team members will divide up winnings. If the game goes into more than one month, that months prize money will be included. As sysop, I will

be playing, but am exempt from winning, or joining any team.
2. ST Magazine - some lucky Atari caller will win a free 3 mag.
subscription.

Good luck to all! :-)

Hey group,

Can someone (or many someones) lay out for me the strengths and
weaknesses of their favorite Atari ST emulator(s)?

At one time, I was somewhat "up" on the state of the art, but things
have very probably changed since I last played with any of them.

Oh, and I'm not interested ONLY in solutions for WinDOZE, since I run
Linux and OS X too.

Thanks for your help,

Joe Mirando

Hello again, all,

At one time, I was running Debian Linux on my TT, but it was so slow when running X that I gave up on it.

I now see more people talking about MiNT/SpareMinT and whatever else. I've been out of the loop for a while, and was wondering if one or two of you kind souls could help out an old Atari user with stuff like pros and cons and where to find some of the cool stuff that you'll no doubt be mentioning.

Thanks,

Joe Mirando

May I suggest you <http://ebmodel3.atari.org/Pack_3D/> that runs
on any machine including Linux, MacOSX and Cygwin.

Have fun !

Hey Joe.

Here are some URLs to start with:

http://atari.st-katharina-apotheke.de/home.php?
lang=en&headline=EasyMiNT&texte=easymint
http://sparemint.atariforge.net/sparemint/

Also, I'd subscribe to the MINT mailing list, just send an e-mail with
"subscribe mint" as the message content to:

majordomo@fishpool.com

Read, ask questions - this will get you started. :)

You can't possibly compare the two. Linux is a completely different operating system than the built-in TOS. There is absolutely no way to run a TOS/GEM program under Linux on an Atari compatible computer.

FreeMiNT is, in a sense, the latest version of TOS. SpareMiNT is a distribution of FreeMiNT that contains about everything you would need. EasyMiNT is a simple installer for SpareMiNT, which doesn't have an installation program.

He did not asked for links on where to download emulators, but on something specific:

"Can someone (or many someones) lay out for me the strengths and
 weaknesses of their favorite Atari ST emulator(s)?"

So well you can give a link to the Aranym package, but you should at least
try to reply to the initial question :)

I have been trying to connect my falcon and TT using Bnet. After Bnet is run I see the Bnet drive on both compters. When I click on the drive on the TT I can see the falcon folder but when I double click on the folder it says it is empty. The same thing happens on the falcon except when I dbl click on the TT folder, I get a message Cannot connect to drive.

The Falcon is running magic 5.11w/sting installed. The TT is running TOS 3.06 and sting.
Bnet Is run from the Magic start folder and on the TT it is installed as an .ACC. Both the TT and Falcon I connected with Daynaports to my router. Both TT and Falcon are able to access internet thru the router which is connected to a cable modem.

Has anyone had any success with Bnet. What is the rules for setting the Hosts.inf file? Do I need tabs or spaces between the parameters?

Thanks.
Claude Bourgoin

Has anyone

Do you act for the living of the ATARI platform, or do you only speak ?

Act are in the real life ... Words are vanishing :(

I'm an author of <http://ebmodel3.atari.org/Pack_3D/>, it is a real
act, not only words. You probably didn't do something similar.

I wish you could understand ;)

Regards,
```

I have a Riebl card which doesn't want to work in my TTs. Since I have tried the same card in 3 different TTs, and I have a different VME card which does work OK, I don't think it's a TT VME problem.

Using the Devpac debugger, I can read & write the memory ($fe010000 -> $fe01ffff) on the card, but as soon as I try to access the memory-mapped I/O ports at $fe00fff0 I get a bus error. If my understanding of the Atari VME implementation is correct (this is a big "if"), this failure is (or can be) caused by the board not responding within 255 cycles of 16MHz.

Is there anyone familiar with this board or this kind of failure who can suggest what might be the failing component on the Riebl board? My thoughts are that it might be the crystal or the Lance chip itself, but I only pretend to know a bit about hardware ...

FWIW, there are no obviously overheated chips, blown resistors, leaking
caps, bad solder joints, shorts, breaks etc on the board itself.

Thanks in advance for any & all suggestions,
Roger Burrows

Well, Joe asked for the strenghts and weaknesses of the existing emulators.
If you think that this "speaking" doesn't deserve an answer that goes
further than "try my emulator I'm the author try it I did it", you could
at least reply to the question and tell us, as requested, its
strenghts (apart "I'm the author") and weaknesses (apart the fact that
you're the author).

Simon

I suppose that you know that the jumpers on the card must be set
differently depending on whether you use it with a TT or a MegaSTE?

Hello Joe,

I run Linux myself and have a bit of experience with Steem. I currently
use the latest Ubuntu Dapper Drake distro on an AMD64 running in 32
bits, a quite powerful machine.
On my computer, the sound is quite horrible and the video is not as
smooth as on Windows, I have quite a lot of frameskip. By the way, I
never run Steem as 'setuid root' because I simply hate running stuff as
root ;-)
Beside that, Steem is as stable as under Windows.

I never tried any other emulator on Linux. I hope it helps a little.

Btw, Rajah said: "carefull : troll contamination from
fr.comp.sys.atari"

Cheers,
frost/sct1

> you're the author).

May I *deeply* emphasis on the fact that I'm not the only author of
<http://ebmodel3.atari.org/Pack_3D/>, that I share its genesis with
Olivier Landemarre and Emmanuel Baranger. That this package is

derivate from ARAnyM, from which we also are not the *only* authors.
That ARAnyM is a *virtual machine*, so not properly speaking an
'emulator'. That if you give a try to this *package*, it supports
Linux, MacOSX and Cygwin (Windows). And that it worth discovering
to see the evolution of what were called ATARI 'emulators' before
this kind of machines appeared. ARAnyM means 'ATARI Running on Any
Machine' and it has a GNU/GPL status.

If I'm not totally answering to all questionings, what am I doing ?

Regards,

Hm, from what I remember about Atari machines (or more specifically ST) emulators:

- Pacifist: was running under DOS, works also under Windows.
- Saint: Windows.

These two ones were meant to only run games and demos, so most work has been put to accurately emulate the ST hardware. There are some enhancement, like running the emulated 68000 at a higher frequency, useful for people still developping ST software.

- Steem: Windows, Linux.
- Hatari: many systems.

These ones are still ST emulators, and also get some enhancements, like having some higher resolution modes, mapping some host directory as hard disk, etc. I prefer these two ones for running pure ST stuff, because I only run Linux.

- Aranym: many systems.

This one is more comparable to an Atari clone (or a Falcon with an AfterBurne040 board), having a 68040 emulated, running the Falcon TOS, so you can run some Falcon programs, but the hardware emulation is far from complete. Useful to develop non 68000 stuff (for 68020 or higher CPU, with FPU).

- Nostalgia, castaway, gemulator.

I don't know these ones, so you'll have to google them yourself.

>If I'm not totally answering to all questionings, what am I doing ?

You are just boasting your ego in meaningless ways.

What you could have said, is that:

Strenghts:
- It's multiplateforme
- It's probably the fastest atari compatible system available
- Supports things that other atari systems only dream of (like native large resolutions and built in modern peripherals)
- (other ?)

Weakness:
- It's not modeled after specific model of Atari, and cannot be used to use any application that is too close from the hardware (demo, games, ...) only Gem based applications
- (others ?)

How hard was that ?

Dbug

There's also the *first* ATARI emulator that is called STonX GNU/GPL

<http://www.complang.tuwien.ac.at/nino/stonx.html>

from which ARAnyM inherits a lot :)

A Java ATARI emulator <http://www.atari-st.lovely.net/>
TOSBox at <http://www.geocities.com/tosbox/> (Windows)
STEmulator <http://www.stemulator.net/> (Windows)

That's without speaking of MagicMac or MagicPC that are available
at <http://www.application-systems.de/atari/>.

Some others have disappeared from internet like TOS2WIN from Aixit,
or WinSTon etc.

Do I have forgotten anyone ?

Hi,

Is there a site which details which Atari ST items hold rarity? I'm thinking of something similar to the Atari 2600 sites which literally detail everything.

Over the last few months I've acquired the most ridiculous amounts of Atari ST kit that you could imagine, such that I really don't know what to do with it all. I certainly can't keep it so was going to pass on rare items so others may appreciate them. I just don't have the heart to take it all to the dump.

Thanks,

Aly

Hi Aly! I don't know if there is such a site, but you could always
post a list here and ask people to comment on the rarity of items.
My comment would be that most stuff is not very rare with the
exception of ICD or "LINK" host adapters. Of course everything is
rare if someone is looking for it at the time :-)

Mickael,

> He did not asked for links on where to download emulators, but on something
> specific...

Oh hell, we've all been in the Atari arena for so long now that if we can't be happy to get whatever we can from anyone who wants to offer something..... well, I guess we'd move on to WinDOZE and just forget about Atari all together. ;-)

In short, I'm more than happy to take ANY information that anyone wants to provide.

Actually, if I had been thinking, I would have also asked for links too, so he actually saved me from having to ask for it. <g>

Thanks,

Joe Mirando

Francois,

> Act are in the real life ... Words are vanishing :(

Heh heh... Sort of a variation of Saint Paul, is it not? ("Faith without good works is dead"). While I do not want to interject religion into this discussion (oops ;-)), It IS an interesting point, and one which fits within your reply. :-)

> I'm an author of <http://ebmodel3.atari.org/Pack_3D/>, it is a real
> act, not only words.

Speaking for myself, I only WISH I had the talent to write code like that. I realized very early that I would never be a programmer. While I could flowchart and code, if you looked at my work and measured it against that of a REAL programmer, mine was 'ugly'. The 'real' code and flowchart was.... elegant. I can appreciate the beauty of well written code, but the ABILITY is what I lack.

Thank you again,

Joe Mirando

Francois,

Okay, let me ask this:

As one of the authors (and a user), what do YOU feel are the strengths of this product?

Since the release of ARAnyM, I have been interested in the philsophy of a "virtual machine" as opposed to an "emulator". Could you explain the difference to me?

Thank you again,

Joe Mirando

Frost,

> I run Linux myself and have a bit of experience with Steem. I currently
> use the latest Ubuntu Dapper Drake distro on an AMD64 running in 32
> bits, a quite powerful machine.

Yes, that does sound like a powerful machine. My setup at the moment is:

2.80 GHz Pentium 4 / 1 GB RAM running Mandriva 2006 (IIRC).

> By the way, I never run Steem as 'setuid root' because I simply hate
> running stuff as root ;-)

Yes, it is my understanding that there is a reason that you shouldn't
run most things as root. ;-)

> I never tried any other emulator on Linux. I hope it helps a little.

Yes, ALL information helps.

Thank you.

Yes, and I think I have them set correctly according to all the docs I could find online. According to the Linux driver source, the memory addresses for the TT & MegaSTe differ, and the addresses I can modify correspond to the TT setting, so I'm pretty sure that part is right.

However, I do have a MegaSTe, so I should try it on that as well, thanks for reminding me!

Of course, what I really need is a schematic (yes, right) and a 'scope, then I might have a reasonable chance ...

I haven't come across such a site, but here's a list of some rare-ish
items (including stuff for TT):
260ST
2080ST
STbook
STacy
>4MB RAM upgrade for ST systems (Marpet?)
CDAR504 CD-ROM drive

Atari Laser printer & supplies (drum etc?)
3rd-party TT RAM board for TT (supporting > 16MB)
8MB ST RAM board for TT
VME boards for TT/MegaSTe (ethernet, video)
TT monochrome monitors

I welcome any corrections or additions to the list.

Roger

Hi Roger,

good point to start with ;-)

List of rare Atari ST series items:

RB> 260ST
RB> 2080ST
RB> STbook
RB> STacy
RB> >4MB RAM upgrade for ST systems (Marpet?)
RB> CDAR504 CD-ROM drive

RB> Atari Laser printer & supplies (drum etc?)
RB> 3rd-party TT RAM board for TT (supporting > 16MB)
RB> 8MB ST RAM board for TT
RB> VME boards for TT/MegaSTe (ethernet, video)
RB> TT monochrome monitors
RB>
RB> I welcome any corrections or additions to the list.

4160STe
DMA and MegaST bus networking solutions (PAM's, Bionet)
MegaST bus graphics cards, math coprocessor cards
XT/AT emulator boards (PCSpeed, ATonce and the like)

in general: almost any hardware extension

Regards,

Alexander

Hi Francois!

> Sorry ... Who are you ? Because I know Dbug ? Not about you sorry !
>
> The best thing to speak about 'emulators' is to discover them first.
> My answer perfectly fits to the topic that was launched by the primal
> post. Are you kidding me ? Did you experienced 'emulators' ?

Do you know why I know quite a few people who dislike aranym?

Because of incredibly arrogant posts like those of yours in this thread.
Quite unbelievable :-(

Now to answer the OP's question:

MagiC-PC (Windows, Linux with wine)
========
It is the most comfortable and stable one. Under wine it has graphics errors, but still runs!
It is also very fast. However it costs a lot. Still!

Aranym (cygwin, Linux):
======
Lots of tiny issues here and there, but it runs MiNT+XaAES, which is great. It is very unstable under CygWin. On Linux it is quite okay, but by far not as comfortable as MagiC-PC. Pity, because MagiC really sucks.

Steem (Windows)
=====
I think there is a linux version, but I dont use it. Steem is perfect for hardware close stuff (debugging, old games etc.). It has a very good GUI and is a piece of cake to set up and use!
But you can only run TOS on it, but any TOS version you like (again good for testing).

These are the emulators I know and use. I have stopped using aranym again, because under CygWin it is just too unstable and I dont know why (aranym? fvdi? libSDL? Windows? cygwin? who knows)

Cheers, Ingo =;->

> of this product?

Well ... It's difficult for me to answer. Would you tell about your
latest born baby his defaults and qualities, compromising his future
regarding to other peoples. Well ... It will lives its life :)

But I'll try an answer.

The problem is that ARAnyM is young. It has not yet reached its 1.0
version. This is a very ambitious project. And with a community
development, it relies on volunteers that can spend time and
efforts for it.

The very strong point is that the package that is released includes
3 host platforms, but it could include more, with a strict same
behavior on every hosts. That means whatever hardware suits
to your preferences, you can exchange knowledge with any other user
or developer. And it is a true ATARI platform, like it should have
exist if ATARI Corps had followed the production of hardware.

> Since the release of ARAnyM, I have been interested in the philsophy of=

=20
> a "virtual machine" as opposed to an "emulator". Could you explain the =

> difference to me?

Well, many things have already been said on that point, and it is a
sensitive point in discussions, everyone having one's own opinion.

I would say that an 'emulator' tries to fit the closest to the
originating hardware, and a precise machine, to have as much
existing softwares to work properly with it, even if it is badly
written. Most of supported software are non still maintained (games).

A 'virtual machine' tries to take as much portable features as
possible to be extended to the most recent software and hardware
abilities of host machines and operating systems.

An 'emulator' is intended for nostalgia. A 'virtual machine'
prepares the future of ATARI hardware and software.

> Thank you again,

That's my pleasure :) I wish I answered well 8=B0)

Howabout this question:

Are there any that support any useable connection through STinG?
I've tried to tunnel a ppp connection through STEem using a
bidirectional pipe into STEem's emulated serial port, but it's
far too slow.

I was hoping to be able to use a bridged TCP/IP subsystem much
in the same way that VMWare does, but no avail.

Anyone?

I've not being built a cathedral ;) I've only build a 3D package with
two friends and the help of the ARAnyM community ... It's very
difficult to speak about creation without references to religious
concepts. I'm just speaking with common sense :)

I realize when I was teenager that I would never reach the genius of
authors from bars arcade games that I was playing. My only merit
was to react that I could learn, and work on some programs that
nobody else would write in place of me. It has some interest for me,
and might perhaps be useful for somebody else.

Your interest is my reward :)

> Thank you again,

You're kind.

I'd like to strongly point out that Fran�ois Le Coat is *not* one of the authors of ARAnyM, contrary to what he is trying to make everyone believe in this thread. He helps package the Pack3D "distribution" of ARAnyM and tests and packages ARAnyM a lot, though.

> Since the release of ARAnyM, I have been interested in the philsophy of a

> difference to me?

No one other than Fran�ois uses the term virtual machine now. It was used at the launch of the ARAnyM project to diffenciate it from emulators that were trying to emulate an original Atari computer as close as possible. ARAnyM is more like an Afterburner040 emulator, whithout some Falcon stuff.

Jean-Fran�ois Lemaire

Code like what? Pack3D is a distribution of ARAnyM (and a very good
one) with some applications added. Not a program. Unless you were
talking of the said applications?

Expose video card/digitizer for the Falcon.

I should add *working*, since so many of them did not. :(

>4. PARITY DISABLE
>8. TERM ENABLE

From this it looks like you have termination set on for both (6. and 8. respectively) - not a good idea! Only terminate the far end!

Are you sure the termpower from the Seagate is looped through? Try reversing the physical order of the drives.

I know it shouldn't make any difference, but I find that with the CD-ROM, EZ-135 and HP tape chain on my Falcon, it sometimes matters which order they are connected in; in one combination (can't recall which) one of the drives isn't seen for some reason.

Regards, /Peter/

Thanks, I rename sting.ovl to network.ovl and now I can get to google, but when I try to access the atari-users web site it never loads from highwire, I can see the message "receiving from atari-user" then "sending to atari-user", but Atari-Users page never loads. Any suggestions. I am using the latest version of Highwire.

Claude

Recently the ftp-server underwent some changes. For the moment it seems impossible for anonymous users to make uploads to the incoming dir. I hope it will soon be possible to make uploads to the incoming dir.

In the mean while you can always send the uploads directly to me.

Just hit <enter> or <return> a couple of times, and the BBS software will start right up.

Command line/shell, Hyperterminal, console, eterm, Telnet-ST, all of these work fine that I have tried...

Hello,

CD Writer Suite version 4 is out from Anodyne. It works great and now supports DVD players/writers. It can even backup a Mint partition. However, only the Restore option works in CDBackup not the File Restore. You also cannot bring up the contents of the backup using the Session.CPX file. You can backup the partition and use the Restore option to re-write all the files to a partition. I was able to do this on freshly formatted 2 gig Jaz cart. I used OSMD to format the cart in an EXT2 format.

I'm looking for something like Cardfile. As a Desk Accessory that doesnt load it's whole file into memory or run out of memory but accesses it's files from the hard drive. And prints to my HP Laserjet 6L onto 3x5 index cards. ===Ben===

Atari Jaguar, 8 Bit and ST Games/Software, Hardware/Accessories & References/ Books. FREE Catalogs on Ben's Domain at http://BensCatalogs.Atari.org or at http://BenSells.Atari.org Catalogs can be attached to,Requested by & Received Through E-Mail at Atari@aracnet.com or BenSells@Atari.org and Please Specify Atari 8 Bit, ST, Jaguar and/or all 3! Or Call Ben anytime at (503)256-9974!!!

The problem turned out to be the NVRAM chip. I replaced it and
everything worked fine even after leaving the Falcon for a few days and
rebooting, the IDE drive comes up straight away. Before it was very hit
and miss.

The clock also works now which is a bonus :-)

Ian.

Thanks everyone for the help.

I will be swapping out the hard drive and etc. to see If I can get it going.
Will post the results.

What gets me is the disk drive not working, but power getting to the hard
drive,
even though the hard drive may not be spinning up completely.

Folks I've been going through my Atari Storage and have some extra
items that I had planned to put up on E-Bay. Some I have more than one,
others I have only 1.

I don't have a list ready yet.

So If anyone in US/Canada and maybe overseas is looking for a special
piece of original software or hardware for the Atari ST/STE/MegaST/
MegaSTE and or Atari Falcon 030. Then do contact me thru
e-mail as I may have the item.

If you tell me what you are looking for, I will search thru my many boxes of
Atari items for it before I go to E-Bay with it.

I also have some Brand new Cables, such as SCSI, Centronics and etc.
If ya need a good cable or two, let me know what type ya need.

Also have misc. parts and things like memory boards for the Falcon.
And many good Books and Mags.

Thanks,
phantomm@bellsouth.net

If you do #3, please make sure you support arbitration (like the
Link96/97).  Arbitration is *required* since ye olde days of SCSI-2, and
much current hardware won't work with the ICD Link 1/2 adapters because
of that.

As far as #4 is concerned, what I'd *really* like to see is an IDE
adapter for the TT.  It can be soldered to the MB as far as I'm
concerned, no need for an external-only box.

But alas, I doubt the demand is there ...

Roger

Roger,

Why don't you just get an IDE to SCSI adapter?

Check out the ACARD one at
http://www.acard.com.tw/english/fb0101.jsp?type1_idno=2

Is that IDE to SCSI or SCSI to IDE ;-)

I use my TT with an adapter. I have a 10GB IDE HD on the internal SCSI
bus. Alas I cannot fit the drive with adapter into the case without
some modification, but it works great, and its quick.

The adapter is made by Yamaha, was intended for those people moving to
Yamaha's IDE CDROM drives but still had scsi adapter cards. I bought
mine for a couple of euros off evilbay.

Coda.

I could use one.

I have 2 spare TT's. I must have done some stupid thing with
wrong termination. I managed to get both SCSI chips dead.
Both surfuce mounted :-(

I would like the memory of that day wiped out of my mind.

When I tried connecting with another set up, I happened to
do it on the still good TT by accident.
All TT's look the same.

     Hello Henk!

HR> I must have done some stupid thing with wrong termination. I managed
HR> to get both SCSI chips dead. Both surfuce mounted :-(

Sad thing, but guess what happened to me with my first TT - exactly the
same. But I assume that it was no matter of termination but unstable
external wiring that lost contact while power was turned on.

HR> When I tried connecting with another set up, I happened to
HR> do it on the still good TT by accident.
```

Ouch!

Did you think about replacing the SCSI chips? That's what I did - cut the pins of the damaged chip, unsolder them separately, solder a SMD socket and plug in the new chip... took me almost one day. I had to use a flying wire to replace a copper pad of the PCB by flying wire as I accidently removed it with the pin...

The TT still works flawlessly with SCSI devices!

If I remember correctly the material cost (SCSI chip plus socket) was below 30 Euro. Just checked BEST electronics prices: 15$ for the L5380 (used in the TT), 20$ for the L53C80 (used in the Falcon) - not sure about the differences.

If you can't do that yourself or have no friend to help you out feel free to contact me!

Regards,

Alexander

I have a TT030 connected to my home network with a daynaport. The problem is everytime I turn on the TT with the daynaport connected the TT030 crashes after it loads one of .stx files.
In my auto folder I have Sting.prg, SCSIlink.prg and have only the 3 sting network .cpx.

HDDriver sees the daynaport because it tells me that Daynoport rom is ver 2.0F. I have ten megs of ram in the TT. I am only using TOS as the operating system.

This same daynaport works fine on my Falcon running Magic 5.11.
Any suggestions will be greatly appreciated.
Claude Bourgoin

Claude,
There was a problem at one time with HD Driver V8 and Daynaport and you
don't say which versions you are using. If you have HDX V8.xx you need v0.71
of the Daynaport box. In any case it might be worth trying V7.xx of HD
Driver...
Dave.

I doubt that this is a HDDRIVER issue, otherwise I would expect problems
with the Falcon, too. You should check your resident programs, AUTO
folder and accessories.
By the way, I cannot find you in my database of registered users. Can
you please send me the serial number of your HDDRIVER? Thank you.

Hi,

I need help in having a development environment up and running under aranym for atari-st.

Long time ago, I was a Mega-4 owner but does not have access to the hardware and various software tools anymore.

For a project, I have to re-compile and debug a program written for ST... it will be re-engineered and deployed potentially under linux.

Therefor, I need access to gcc, gas, ld and gdb for starters (parts are written in assembly).

I have the emulator Aranym-0.9.0 running and nicely booted. I was planning to put easymint on it as described in
http://arnaud.bercegeay.free.fr/ezaramint/

But run into problems during the installation. It is identical as described by Jeff
http://www.google.com/search?hl=en&lr=&q=jeff+mitchell+atari+mint&btnG=Search

What will be a good method to have access to gcc, gcc, ld, gdb, ... and emacs or vi on the aranym. Any pointers are welcome !

Should I pursue mint ? which version/type ? which desktop ? ... ? If you have an disk image that I can boot from that would be great as well.

Regards,

-Luc

(it is very easy to sell something cheaper that you had no r&d into it.
you ripped it off someone else's hard sweat and labor.
 i have sued to prevent this from happening to atari software that i
own in the past, and i will again if i have to. its a matter of
principle.

(if you have any sort of simple o.s. on board did you insert your
name, and date? did you put your name on the circuit board? if so you
might have a case if this fellow simply ripped you off completely.
 no matter how small the project we do here, everything, and i mean
everything gets copyrighted.
 you would be surprised what some people will use older technology for.
it has its uses in todays technology.
 so you might be sitting on big, or small, or worthless technology,
but its yours, and you should spend a little time and the few extra
pounds to make sure it stays yours.

I had the same problem when I was trying to install th EtherNEC card in my
STe. I replaced some STX files and deleted the ones that I did not need and
STING ran like a dream.

I have PSU problems it seems. Main cumana enclosure just about spins the drives up. Just bought a new JMR SCSI enclosure which has a 2amp switch mode in it, that won't it ever power any thing up at all (there is power). So currently have wires hanging about everywhere at the moment and using a PC ATX power supply.

Bit power hungry these drives.

Hi there :)

Ohhh pretty safe really. The sweat to go through to mass produce it I don't think anyone would be prepared to do. The PCB's for example were about �250 ($500) alone. Someone would have to have a hell of alot of faith in the project to go out and do that. The only reason we did it was because we were comfortable with how it worked, designed it, and literally knew it inside out. Overall with it being mass produced I can make about 1-2 an hour. Without the 'modular' pieces of it I would image it would take ages.

Name is on the PCB, and the MCU is code protected such that the data can't be read off of it. :D Also lots of quirky stuff in there too.

Not that many of you know this, but your PeSTs, if you connect certain pins of the chip to a 38400 RS232 port you can see what's going on, like when the mouse initialises, and when PeST checks the mouse every 2 seconds to make sure it's the same one. :D

Moving into other projects now so comments noted, thanks atarisales :)

Aly x

Then it would be easier to rewrite/update/modify it to run under Linux first. It should not be a problem to compile/make an Atari version afterwards using gcc.

If you want to compile your program natively under MiNT, then you'll need one, but you have a third alternative, that is to use a cross-compiler (i.e. run the compiler under Linux to generate an Atari executable). There are some binaries already available on sparemint website, or you can compile the cross compiler yourself. There are some tutorials about it on the web.

> Should I pursue mint ? which version/type ? which desktop ? ... ? If

I don't think current Aranym disk images comes with dev tools, or the minimal mint setup needed for installing rpm stuff from sparemint website.

Hi,

I have updated my PCI story...

http://perso.orange.fr/didierm/ct60/ctpci-e.htm

The next step is to test the VDI part rewrited inside the TOS.

Regards,

Didier

Hello

If you get a Seagate, do not pay much for it. They often have a capacitance problem, work in Seagate's test fixture, but not in the real world.

My TT has an adapter to SCA, which was not cheap, and is at the moment extremely happy with a 9.1 gig Hewlett Packard DNES-309170. On the other hand, found a batch of them on E-Bay, the first had bad sectors only found with H.P.Vetters Optimizer program, but the next three were fine. It can shut parity off.

My general advice is to get more than one of whatever you find, just for luck. The one new drive I bought from a computer store has not worked yet.

Compaq have given me some odd problems. They can do narrow bus transfers, and if they work at first, they will last for a while. What some of these did to me was to add one bit to some characters being transferred, sometimes.

In short, I have quite a number of drive magnets pulled from pulled drives.

Your largest problem will be providing TERMPWR to the LINK. It has to come from your external drive. All my drive boxes have a diode from 5v to the TERMPWR wire.

My adapters come from CS Electronics, which was hard to find using google.

If you can find them, look at the prices, which are typical, assuming you can find anyone else making what you want.

The bottom line is that adapters are available, and reliable, and drives are surprisingly variable. How is this for a start?

Jim

techie_alison <retro@dial.pipex.com> writes:

: What is the arrangement with SCSI hard drives and the Atari ST? I've just
: acquired an ICD LINK adapter and am trawling the web at the moment for

: lowish GB SCSI1 50-pin drives.

: The Seagates seem to come out top as there's specifically a 'parity' jumper
: on them.

: Can 68pin or 80pin drives be used with an adapter, or does the 16bit
: transfers create an issue?

: Would it be possible for someone to give me an idea of what I'm looking for?
: As trawling eBay at the moment I can pick up plenty of these Compaq
: ultrawide drive pulls, assuming they have a SCSI1 mode and can perform 8 bit
: transfers.

: The ICD Link btw will recognise my SCSI Cumana (was for Acorn BBC
: Archimedes) drive, so is assumed to be functional.

: Thanks kindly in advance,

: Aly

I did the same thing too, and it works just fine. Took a while, but
worth it to revive the TT. Luckily I had a TT service manual (purchased
from Best), so I could check out the connections & make sure all of the
SMD socket pins were soldered properly.

Actually I have a couple of different ones, and they both work well. I'm
using them on the TT to test out DVD support via SCSI, and I've also
tested REALLY large partitions.  But what I'm hoping to get by having an
IDE port is faster data transfer.  The SCSI chip on the TT won't go any
faster than about 2 MB/sec.  IDE should go faster.

What's this SCSILINK.PRG program?  You just need SCSILINK.STX in your
STING folder.

I purchased the Falcon game "Running" from someone on eBay, but, alas
disk #1 is damaged.  Can someone help me out with the files from disk
one.  Reply directly and remove the obvious spam trap.

TIA

For sale:

The Atari Compendium - books, volume 1 and 2 (as new, excellent condition).
+ a book on AES (can't remember the name of the book, I'll look it up today).
$25 + freight for all of them (3 books).

HiSoft C Interpreter - software, including a big manual/book and disk.
$25 + freight.

Lattice C - software, including 3 comprehensive books (programming manuals/
references)
and disks.
$25 + freight.

Or buy everything for $50 + freight.

Freight cost depends on where you're located. The books are quite big and heavy,
especially
the Atari compendium, so the freight cost will probably end up around $25 (I'm
guessing,
will check in detail).

Please email atari@mhc.se for more information.

Kind regards
Mikael

RJH> For some odd reason, the Link doesn't get the power it needs from the
RJH> 2 bay case alone.

The Link(2) needs power from the SCSI bus pin 38 (TRMPWR - terminator power). Though any SCSI device should feed this line many don't. In a SCSI case the SCSI cables usually are provided but not "touched" (i.e. no additional connections are made).

When I bought my first Link2 I did not know about this and sent it back thinking it was damaged, for the SCSI-HD was working perfectly on my TT but not on the ST/Link2. I was charged for the functional test ("fully functional") and advised to ensure supply of TRMPWR. So I did it manually (wire, diode, soldered to the Link2)...

Regards,

Alexander

One of those drives has a "trmpwr" link. Is in set ?

I recently changed the IDE drive on my Falcon, and I've noticed that it has difficulty booting from the IDE drive. I've put an original Atari IDE drive (64MB!) in to the Falcon and still get the problem. It boots fine if I put a disk in the floppy drive with a AHDI on. The Falcon boots AHDI, finds the hard disk and will even get the desktop config files, etc.

The HD is properly installed on the 'C:\' drive, etc.

Any idea what's happening. This particular Falcon has a fading NVRAM chip so not sure if that is the problem?

Cheers

Ian.

That should be AHDI is properly installed on C:\ drive.

Intrestingly after a few cold boots it works fine (ie boots without
the FD) - but if I leave it a day or so I get the same problem.

Yes, the IBM is as follows;
3. ID BIT 1
6. SCSI TERM ON
11. DISABLE PARITY

The Seagate is set as;
1. TP TO BUS
4. PARITY DISABLE
8. TERM ENABLE

The Seagate I've had the most success with so far. I'm tempted to pull the ST157A out of the MSTE back home so that I can establish a control baseline for comparison.

Uwe, are you ok with a PayPal payment and emailing HDD over? The inability to be able to format and partition is preventing me from going further and it's such a well written bit of software.

That is wrong. The SCSI standard only requires the host adapter to supply TERMPWR, which is the Link in this case. Other devices *may* provide

TERMPWR, but are not required to do so by the standard.

Many devices have a jumper, and most have the diode and fuse required by the standard, so if the TERMPWR line has been shorted once in the past, it may well be that the fuse is open, so it is best to measure the voltage on the TERMPWR pin on the bus to be sure.

cu

You sure its not stiction? Or something like that with the hard drive.

After all, if its one of the first 2.5" drives that came with the original
Falcons, its getting a bit old, isn't it? (13-14 years).

I remember an old Megafile 60 that I had on my BBS for awhile. It was fine
as long as it was running - turn it off, cooled down, it didn't want to
start back either...

Just a thought.

Sorry for this, I must have changed the "may" to "should" over the time,
probably because this was more helpful for the Link adapters...

Regards,

Alexander

I sell the following software for Atari:

--> Cubase Audio Falcon - including dongle, floppies, manuals and box.
Everything original in good shape.
$75

--> Interface (pro resource editor)
$10

--> NVDI 4
$10

--> Extendos Pro
$10

--> HD-Driver
$10

--> Dig-It (a sampler/tracker for Falcon 030 and STe)
$10

--> Nevada Cobol for the Atari, including a comprehensive manual.
And a big book on the Cobol programming language, which I bought
separately. I have a picture of these which I took with my mobile camera.
I can email it to you.
$25

Add freight from Sweden to the price. The freight cost depends on where
you're located and how many items you buy. If you buy more than one item
then I'll give you a discount, no problem.

Please email atari@mhc.se for more information. Don't forget to tell me
where you're located, so I can calculate the freight cost.

Kind regards
Mikael

I think you are probably right - I guess that the FD boot might wake
the drive up differently to a regular boot?

Cheers. Ian.

Just follow the appropriate PayPal link on
http://www.seimet.de/hddriver_english.html. As soon as I have received
the payment I will email you the software. The English manual and the
driver floppy disk will arrive by snailmail.
Please keep in mind that the full version will not solve the (most
likely hardware-related) problem with your drives addressed by this tread.

Actually, I was guessing that by the time the floppy got accessed, read, then found its way to the HD, that maybe the HD had enough time to "catch up".

With the built in mem check and HD delay built into that TOS version, what happens if you wait for the black bar to go down by itself and not hit space to speed it up? I'd be curious if that would give the drive time enough to come up to speed, so to speak.

I did it too, but I kept the standard jacks on the back. I found that I had a light left bias, but I didn't care too much as I obtained a FDI/FA8 setup, which was so much better.

Coda.

That's what it sounds like. :) I can tell you this though, if it isn't set then the drive doesn't get recognised. The other two combinations were tried too.

Are you getting consistent recognition now then on the Seagate?

```

Greetings,

I have an Atari Falcon, that has a problem and would
like to fix it if possible, instead of using it for parts.

It is an original Atari Falcon 030 with stock 4megs and
Conner 84 meg IDE hard drive.

This Falcon looks New inside and out. Really Nice.

There has been no modifications what so ever and in fact,
I don't think anyone else has had the case opened besides
myself.

It still has the factory speaker and copper shield on the left side
of the Conner IDE. No FPU, and a Jumper on the expansion port.

I do know that the power supply is good.

Now upon booting this is what happens.....

Green Power Led comes on as does the FAN, I get 1 Blink of the
Yellow Hard Drive Led on the Keyboard, the hard drive starts a faint
Clicking noise. (I'm not sure if this is the normal sound of these older
Conner IDEs or not, I do have 2-3 of them.)

The internal disk drive does not flash its LED and appears dead.
I get nothing on the Monitor screen. (Black).

The system reset button doesn't seem to work.

I inserted a blank disk in the drive and cold boot from the power switch,
Same thing, the disk drives Led does not flash and the drive appears dead,
no disk access.

I have looked fairly close at the motherboard and see no problems.
No High Heat marks or etc. Motherboard is clean as can be.

There has been no clock modification.
R216 is a surface resistor
R222 - surface resistor
R221- has solder instead of a resistor.
R217 - Brown resistor with 1 Black band.
R234 is a surface resistor.

There are no Piggy Back chip(s) on U63 or anywhere else.

TOS Chip is labled with a silver label as..
1992 Atari Corp TOS 4.01.
Someone has taken a Red Marker and placed a 4 over
the 1 in TOS 4.01, so I think it is TOS 4.04.
(I think this was done at the Factory)

I am not sure what is wrong with this Falcon, It appears New
inside and out. Best Looking Stock Falcon that I have.

I was thinking that the NVRAM maybe bad, if so would it cause
the disk drive to appear dead?

The disk drive is accessed normally before the hard drive,
if I remember correctly. But this is not happening.

I have a Falcon motherboard for parts, if I knew for sure
what was wrong. I could swap the NVRAM if it sounds like
this could be the problem. If its a surface mounted chip thats
bad, then I would probably send it to someone to fix for me.

Could a bad disk drive cause problems with the display?

I have swapped PowerSupplies, so I know its good.

Also, I am not sure if the Hard Drive is setup correctly or not.
I've not swapped it out to check it. But it does not seem to be
loading anything. I only get 1 Blink from the Yellow hard drive
Led, and the drive starts up. It does seem to be a bit noisy (clicking).

I do have extra parts and etc to swap out as well as other
Falcons that work fine.

Where should I look or go from here?

Any help is much appreciated, I would really hate to
turn this one into a parts machine.

I would definitely try swapping the TOS. It sounds like even the most
basic TOS initializations are not being completed. It actually sounds
pretty bad :(Even if it's clean, it could easily have been hit with a
power surge or spike.

Thanks,
Mark

Hi,

First try to remove both the HDD and the Floppy drive. The system
should boot this way also. If not, try to reset the NVRAM (there is a
key combination for this, I don't remember what).
Are you sure, that your monitor cable is OK?

Regards,
Jozsi

From the "sound" of it this does seem to be the source of the problem,
good call.

The Connor drive was original fitment, and it's now very old.

If the hard drive clicks more than a couple of times it may not be spinning up properley. Don't know about Falcons but on PCs if the IDE hard drive does not spin up the machine stays dead.

> I do have extra parts and etc to swap out as well as other
> Falcons that work fine.
>
> Where should I look or go from here?
>

I would start by swapping the hard drive out, and seeing if the machine boots without it. If that does not change things then minimum memory and also re-seat any socketed chips.

> Any help is much appreciated, I would really hate to
> turn this one into a parts machine.

I have a falcon connected to a network so it can access the internet (cable). When I try an url in highwire, i.e. www.google.com I get an error message "No route to host", CAB 2.0 works fine for this url. Falcon has Magic 5.11 and NVDI 3.0. Help!!!!!!

Thanks
Claude Bourgoin

Did you setup the HighWire network.ovl? Rename the OVL for your
prefered IP-stack(stik, iconnect) to network.ovl in the modules
directory. There is also a readme.txt in the same location.

If it is old and for ST, it might be "Psion Chess".

Hi!

> It had great 3D graphics and it ran in high resolution screen. please help
> me find it again! thank you!

I know Chessmaster or Chessmaster 2000. Something like that. When it
started, it said:
"I am the Chessmaster, wanna play a game?"

Was it that one?

Cheers, Ingo =;->

It didn't run in a high-res screen, but I was always partial to
BattleChess. Loved the animations... :)

Hard to sell these items, so I lower the prices.

The Atari Compendium - books, volume 1 and 2 (as new, excellent condition).
+ a book on AES (can't remember the name of the book, I'll look it up today).
$15

Lattice C - software, including 3 comprehensive books (programming manuals/
references)
and disks.
$15

Nevada Cobol for the Atari, including a comprehensive manual.
And a big book on the Cobol programming language, which I bought
separately. I have a picture of these which I took with my mobile camera.
I can email it to you.
$15

Interface (pro resource editor) +
NVDI 4 with printed manual +
Extendos Pro with printed manual +
HD-Driver with printed manual
$15 for all of them.

Or buy everything for ... well give me an offer and I'll consider it.

Add freight from Sweden to the price. The freight cost depends on where
you're located and how many items you buy.

Please email atari@mhc.se for more information. Don't forget to tell me
where you're located, so I can calculate the freight cost.

Kind regards
Mikael

I think it was Chessmaster 2000 like someone already mentioned. I too
liked Battle Chess.

I need to get my ST out of hibernation and fire up some of the old games.

Hi denbler!

Try Colossus Chess 4.0. I think the ST Version was called Colossus Chess X. I have only found this article, pointing out some troubles with the Program.

http://www.stcarchiv.de/am89/05_colossus.php

Best Regards,

Daniel Mandic

Yes, I renamed the network.ovl to sting.ovl and still I get the same error message. I originally posted that I have NVDI 3.0, what I really have is NVDI 4.11.

Claude

>I've also tried it with JP6 clear.

Hello;

I use an IBM drive (DSAS3540) and had problems with it (could not be recognized and booted from unless reset at exactly the right moment, until I set the following option:

>JP7 - DISABLE UNIT ATTN

I vaguely remember that this setting was from some text that I found somewhere, and it explained that if "unit attention" is enabled, the drive sends at powerup more data than TOS expects at that moment, and proper communication can no be established. IIRC different TOS versions were supposed to behave differently in this matter, I tink that TOS 2.06 was a division.

>JP6 - SCSI TERM ON

This should be set only if this drive is physically at the end of the cable and you do not use other terminator.

cu;

I hope u backuped sting.ovl because u should rename sting.ovl to
network.ovl. Maybe u should read docs more carefull :))

Yes that is possible. I do that now with my Hades060, my STe and my wife's PC.
I use the ftp protacol. Works fine.

That looks interesting. Too bad I cannot use it in the Hades060, but I do have

and use a STe.

Yes I also have the PARCP cable/software and it does work great. 100,000 bytes
a sec transfer rate. The software works best under regular TOS.

What are you using to connect to the internet (STik, STING,etc)? You need to go into the Modules folder and pick the OVL file that pertains to you. Then rename it "network.ovl".

I have no idea, but  I brought my first printer from them, might still have
the glossy printer leaflet somewhere!

It would probably be easier to just find a source for them, 5V,12V is as about as common as you could get. Would be best to ditch the old board and producing a mounting kit to fit a new type supply. Switchmodes are nasty bit of kit, probably a better idea to source a small transformer and use classic regulators for the job. I don't think you could design one and buy all the parts for less than you can buy one though. Apart from the rectifier blowing, then caps drying out, the ST supply has stood the test of time pretty well I think.

Hard drives do not last forever, my backups are never quite current, and
Google can no longer find Charley Image.

Does anyone have a working path, or a working copy I might have? It was
freeware on the website of someone German who made neat accessories for
Atari ST machines.

I think its W01 or soemthing like that, rated at 1amp, so you can imagine
the problems it causes. Actually I had a run in with them a while ago, They
get rather hot at 1amp at mains levels..

Dave Escott from TUS of Macclesfield designed and built some IDE
adapters for the ST, along with those pretty amazing Veloce+ cards
(68020 upgrade and fastram for STE). Shame he isn't around any more.

Also I remember Mario Becroft doing IDE interfaces which were sold in
the UK by Chris Crosskey of ASP. But sadly Mario dissapered without a
trace =(

Wish somebody could get hold of the old TUS designs and release some
more Veloce kits.

Simon

Keychange Music bought the TUS designs.  He just needs 30 preorders to
restart production.  It's a problem that it's STE only though, so I
guess the market isn't that big.  There are many more STs out there
than STEs.

Hello all,
I have a System Solutions Mini S external SCSI HD connected to my 2.5Meg STfm via a Link 97 cable that I no longer require so I though the quickest way of erasing it would be to format it and then repartition using HD Drive V7.5. It formatted ok but I can't partition it, know I have repartitioned this drive before although I can't remember if I also reformatted it at that time.
When I try to partition the drive after clicking ok a pop up box briefly appears that mentions something about partitioning and the end of the second sentence is "memory..." but it is to quick to read it all. Am I being a complete idiot and doing something wrong or have I killed the HD by formatting it?
I also tried partitioning it with AHDI which complained that the HD was formatted with a previous version and requests that I reformat the drive, but when I try to do that with AHDI it refuses.

Thanks,
Stephen Moss

If the box you are mentioning is a regular popup displayed by HDDRUTIL
it should not vanish automatically, but only after having been confirmed
with a mouse click.
There is only one message (at least in the curent versions of HDDRUTIL)
ending with "memory", and it is displayed if there is not enough memory
left to operate.

> I also tried partitioning it with AHDI which complained that the HD was

That's a known bug/feature of HDX.

By the way, can you please send me your HDDRIVER serial number? I cannot
find you in my database of registered users. Thank you.

```

Just need an ACSI one. Something simple, straightforward, small.

What puzzles me though is that so much time has been spent on developing kit with works (barely) with the cartridge port, GALS for internal IDE interfaces which need soldering in, yet no one has put the time into an interface that works straight out of the box.

The reason for this may be that it's not easy, as can speak from experience. IDE is easy enough as it's so well documented, SCSI a little harder. The ACSI stuff (almost SCSI) I need to reverse engineer with a logic analyser. Can't be arsed about sums it up here.

The Swedish ATARI Users Association (SAK)
The Nordic Atari Computer Show (NAS) 2006

Text version 2.0 (eng) 2006-06-02

Updated information about the convention can be found at:
http://www.sak.nu/ E-mail: info@sak.nu

INFORMATION ABOUT NAS 2006

THE NORDIC ATARI COMPUTER SHOW 2006

Where: G�teborgs H�gre Samskola Gothenburg, Sweden.
Stampgatan 13. Same area as NAS 2003,2004,2005

When: 30th of June at 18:00 (GMT +01.00) to the 2nd of July 3, 15:00.
(Non-Stop)
For visitors without their own computers, the best time to visit
NAS is at Saturday 1st of July 10:00 to 19:00 and at Sunday 2nd
between 10:00 and 14:00.

What: A LAN-network with Internet connection is available for everyone.
There's
also a wireless network available if someone bring a laptop, PDA.
Static IP-Addresses to use, but there's also a dhcp scope in the
network.

Theme: ct60/EtherNat, FreeMiNT/XaAES
Seminars to be hold at 15:00-18:00 Saturday. At the moment
we do not have any seminars scheduled. Most users do demonstrate
their systems at
their tables.
Internet caf� with classical original ATARI computers, Falcon with
steinberg
software, sytheseizer, lots of ct60 some with EtherNat, Jaguars to
play

with.

Exhibition:
At this moment Nick Harlow (16/32-Systems) is positive and aimed
to come. We can all help him out before NAS with pre-orders and
also give him suggestions what to bring to Gothenburg.

http://www.1632systems.co.uk
http://www.1632-sales.zenwebhosting.com/acatalog/
nick AT 1632systems.co.uk

There's always ATARI users who sell things at NAS.

Entry: 30 SEK

Food? There's some restaurants close to NAS
microwave owen, coffe maker available. You have to bring your own food.

Accomodation:

You can sleep at NAS. The building is a school, so you do have to bring
all the necessary things to sleep on a floor. There's possible to use
the showers as well. Gothenburg is a big town with hotels, youth hostels.

Info: The latest info, maps is always to be found at http://www.sak.nu/

E-mail: info AT sak.nu (SAK)
mille AT sverige.nu (Mille Babic)
mrfuture AT comhem.se (Andreas Sj��)

Phone to: 0708-35 73 05 (Andreas Sj��)
0706-66 51 96 (Mille Babic)

KEEP THE TOS PLATFORM ALIVE.
WE ARE LOOKING FORWARD TO SEEING YOU AT THE NORDIC ATARI COMPUTER SHOW 2006!

Best Regards

The Swedish ATARI Users Association

t> The IDE/CF side is already done. It's the ACSI/SCSI side I still (note
t> still) need to get round to, a bit of can't be arsed being evident.

Would you try to combine both, the ACSI-SCSI hostadapter and the IDE "side"? Then there was only one adapter for both busses, probably less expensive than producing two separate adapters with one being prerequisite to the other.

t> It wouldn't really be possible to surpass the ICD host adapters, just
t> maintain compatability.

That is the central point anyway, essential so to speak.

t> A 40Mhz microcontroller yeilds about 10million cycles flat out, [...]
t> Moving onto the ultra fast TQFP package microcontrollers brings new
t> problems such as soldering the things and track layout.

Did you consider programmable logic? Probably the gate count was low enough for using a CPLD, FPGAs still are quiet expensive...

Regards,

Alexander

There's this site....

http://atari4ever.free.fr/hardware/drives.html

which has schematics for and IDE and SCSI controller.

Lots of other stuff too.

Alan.

Hi Alison

Nothing wrong with a bit of competition!.

Was the concept entirely yours to start with??

"Crash all day", wot?? Mine hasn't crashed for weeks, when it crashed last
it was Video driver issues.

Maybe you should be more open minded to progress.

I should have been more specific...

Is this your design /idea from scratch or is yours another public domain
solution put into production?

On the other hand I paid around �200 for my STE which at the time was less
than the price of a MIDI card for a PC....
Then there was the free SOZOBON "C" compiler and I could write midi programs
... Also no segmented memory model that really messed up programming PCs at
the time.

The reason for doing straight IDE is that if you emulate the Falcon hardware
```

later TOS will find and boot from it.
I think in the past many IDE drives did not report hardware config
(sectors/heads/tracks) so doing ASCI=>SCSI=>IDE was hard
original SCSI=> MFM adators needed a table of CHS for drive type....

Can you please send me an e-mail with a more detailed description
of the problem. I do not have MagiC-PC so I can not really test this,
but maybe I will be able to find the reason.

Djordje

Actually yes, it is my design from scratch (and Exxos's). Every other one out there needs numerous ancillary components and we gave up trying to reverse engineer them into what we wanted.

How else do you think the thing is 14mm x 21mm?? :)

If you can get hold of one of the compettition and you find it is a copy of
yours then you can take some action, otherwise...

> How else do you think the thing is 14mm x 21mm?? :)

I have no idea and so wont make unqualified remarks /statements.

Hey guys. I was just wondering - can this still be bought? I've got a copy
but I was recommending it to a friend and could not find anyone selling it
via google or Ebay.

Thanks!

I've had a 1040STe for some years, still in new condition.

I would like to change the modem port to a 9 pin like on the MSTE/TT/Falcon.

Can I use a simple adapter to reduce it down to 9pins or will I need to do some re-wiring?

phantomm@bellsouth.net

Yup just a DB9 to DB25 converter and away you go.

Mark

Years ago I recall a discussion on this subject.

Without doing any research first, thought I would ask in here.

Is it illegal to send e-mail or do a posting with the text content encrypted?

As there are programs for the Ataris that will encrypt files.

With all types of hacking and such that goes on, I would like to keep some of my e-mail as private as possible.

Illegal to protect yourself?

Not unless you're in China maybe...

Thanks,
Mark

Looking for a Falcon Keyboard US or UK spec doesnt matter.

Also looking for broken or damaged Falcon motherboards for parts recovery.

Thanks

Ian.

Which parts are you looking on mb ??

I have here a Falcon mb that is dead (short circuit inside PCB).
TOS, CPU, GALs, VIDEL & NVRAM are missing...

Let me know...

If you post encrypted msgs on usenet, I think people won't be amused.

>

AFAIK not any *meaningful* encryption. I.E nothing that won't be easily
breakable.

> > > With all types of hacking and such that goes on, I would like to keep

Or any Western European country, or the States. Not now, but very soon.

Just because I'm paranoid doesn't mean that they're NOT out to get
me...

Well, there is Cadenza's EncrypSTer. It uses a 256bit user definable
key. Not so bad I'd say ;-)

Unless it's in a group that specifically allows binaries, and depending
on whether the server operators were using something like CleanFeed, it
would probably be never propagate very far.

The question isn't "am I paranoid?"

The question is "am I paranoid enough?"

Regards,
  David Bolt

AFAIK it is very illegal e.g. in the United States (a state that has brought
the BigBrother-type oppression to heights never dreamt of by China and such).

I remember that some years ago there was a silly situation about the
PrettyGoodPrivacy encryption program. A new release of this program
introduced an improved encryption algorithm which, at that time, the
US government agencies could not break into. So, that new release of PgP
was proclaimed illegal in the US. The rest of the world, of course, ignored
```

such nonsense, and so newer versions of PgP were 'legal' only outside US.

It seems that the rest of the western world is catching up with this nonsense unimaginable, though. Briefly: if an encryption program is any good at all, it is, or soon will become, illegal in more countries.

On the other hand all this is a minor matter in a world that has suddenly found it quite acceptable to keep certain people jailed for years without any court sentences, or even without any charges raised...

Somewhat more off topic: a bleak future is not only for encryption programs. From what I have seen, it may soon become illegal for an individual even to write any software (and the new machines may refuse to run it, see www.againsttcpa.com), if he is not approved by the allmighty government and multinational companies. E.g. there was a comment on www.videolan.org (home page of a nice freeware multiplatform vultimedia-player software): according to upcoming French laws, it may become punishable by a jail sentence even to publicly discuss algorithms for reading/playing some video media.

Very Interesting....

The last discussion I recall on the topic of encryption in here, most said that
it was illegal in the US to use encryption for e-mail.
That was some years ago.

I can see that most folks would not want to find a posting that is encrypted in
a news group, unless the newsgroup deals with encryption or similar.
Maybe if everyone in the newsgroup had the key to read the message it would
be more welcome. ;)

I would think that some type of encryption is used on Web Sites that allow access
to private info, such as Banks and etc. I'm not positive on that. But there is some
type of software security I would think.

I just don't want to break any federal law for sending a encrypted e-mail to a friend
of mine using an Atari. Not that I would be sending any info that's illegal.

I do enjoy computers, but we sure have lost alot of privacy and etc with the mass use
of them.

Not that I know of in along time.

But years ago, when I was using Oasis, someone while I was online was
able to create a directory on my hard drive that was read only. And I could
not delete no matter what I tried. (Never tried Formatting) Guess that may
have
worked.

Also, while using Oasis to get news groups, I got several text messages that
appeared on the screen. Really Wierd. One said to" E-mail us here Now!"
with no address. And some other stuff.

This happened a few times, then never again.

I have a fairly modified Falcon that has TOS 4.2.

All my other Falcons have TOS 4.04, and I have a spare TOS 4.04 that
I could swap into the TOS 4.2 one.

I was wondering what the differences are from TOS 4.2 to TOS 4.4?

Is there a Text file with the fixes and or enhancements?

Also, before TOS 4.04 was released, were there any program fixes
especially for TOS 4.02, that would be useless on TOS 4.04?

For what I remember with Tos 4.02 there is no end of partition check, so on the good old 45 megs IDE drives that were formated by default with 3 or 4 partitions, you could just fucked up one of the partitions by adding too many things in the previous partition.

Tos 4.04 probably fixed more things, but I don't remember exactly.

With Tos 4.01 vs 4.02 it's easier to notice the difference, the 4.01 is buggy, and has an incomplete "3d look" that makes applications look very strange.

I am trying to determine if I should swap, with this very bad bug, I think
I'll do
so asap!

Also guys, what type of chip is TOS 4.01 to TOS 4.04 on?

I mean, whats the official name of the chip?

I have a Chip Burner and what to know if I can use these type of chips on it or not.

Thanks,

I've been searching the net with no success looking for information about modifications to a Falcon main board to remove bass boost from the output and change the audio in to line level. Does any one know of a web site or have the relevant info. Thanks in advance.

Here I use the PARCP parallel cable. Documented here;
http://joy.sophics.cz/parcp/ Not really networking in the traditional sense
but good for safely getting data back and forth. Quite fast too, about
50KB/s on a bad day.

Trouble is with PARCP is that everything has to be transferred explicitly,
it's more like a data transfer application. But quite reliable and stable.

I have done it. I advise to add RCA connectors on the input to prevent
channels signal blend.
If you have troubles I think I can help you.

I think the problem of end of partition going on the next is on TOS 4.01,
not 4.02.

The difference betwwen 4.02 & 4.04 is that TOS 4.04 do not more need the
FOLDER.PRG in the AUTO.
And a XBIOS function about RS-232 port on Zilog was modified / corrected.

I do not remember the rest... if there is...

TOS 4.02 have a sound bug. You need FPATCH.PRG and FPATCH2.PRG to
correct it for a single TOS only, not with MagiC/MiNT because
MagiC/MiNT correct this bug.

See you,

Cyril.

I have found the best ST solution to be STing for the TCPIP stack
(software) and Ethernec for hardware.  You can find info on my web
site or many others.  http://www.josephplace.com/atari.htm

Hi,

Yes it unfortunately seems like a bunch of sites that are hosted on the same server are currently down. Sorry for this. I have emailed Rob (who is running the server) about it and am waiting to hear back from him.

I will try and post back here when things are back in business again.

Regards,

/Joakim

Hi again,

Rob managed to fix this very quickly, turned out Apache had went down and wasn't automatically restarted as would be expected.

The websites that were concerned should be back in business now.

Sorry for any inconvenience.

Regards,

```
/Joakim

I'm pleased that xaaes.atari.org is back again, as some other
sites hosted similarly. That was worrying because this is
critical and a key site in the evolution of the ATARI scene.

Thanks for your work.

Best regards,

Some of the recent postings about encryption reminded me of an old program for the Atari ST called The Cryptographer from Fair Dinkum Technologies. This was not a tool for serious protection in any way but rather was just for fun generating simple cryptograms and decoding messages and the like. Anybody still have a copy of this or know where it might be available for download or purchase?

Another network solution is always welcome in the Atari world.

Can someone list the advantages over say, the EtherNEC?

Thanks.

Of course there is. But, AFAIK, the only type of security that is permitted is the one which certain government agencies can break when they think it suits their interests.

>I do enjoy computers, but we sure have lost alot of privacy and etc with the
>mass use of them.

Computers are certainly not to blame for the loss of privacy. It is the government(s), or the powers that stand behind them, who first create all sorts of crises around the world, and then, when the world strikes back, provoke paranoical fear of 'enemies', 'dissidents', 'terrorists', etc. as an excuse to assign themselves the rights to press on their own people, but certainly not in the best interest of the people.

A request to keep e-mail unencrypted leaves a very bad taste in the mouth. Basically, what stands behind that request is that they want you to make it easier for the police to spy on you. There is really no difference between that and a (hypothetical ?) obligation to submit all your (paper) mail in an open envelope to a police station before sending it, or to leave the doors of your home unlocked and open at all times so that the police would not be bothered with unnecessay paperwork when they want to inspect.

(By 'police' I meant generally FBI/CIA/NSA/MI5/KGB/Holy Inquisition/whatever...)

Some people do not realize it yet, but the darker pages of Kafka or Orwell have become so very true...

But this thread is sliding off topic (i.e. atari computers). Maybe I should not have replied to it, but I was provoked by a biased post which implied that China is an opressive, nondemocratic country, as opposed to (a paradise in) the rest of the world. China surely is nondemocratic and totalitarian- about as much as the US, or Britain, or..., only in a slightly different way.

I have a falcon networked to 2 PC's, one PC is windows 98, the other PC is XP Pro. I am able to ping both PC's and my router so I know the falcon is on the network. My question is how do I get the falcon to access the internet thru the network.

Thanks.
Claude B.

First off, make sure the Falcon has a defaultroute set to the router. Then make
sure the Falcon can resolve DNS names via the router or via your ISP's
DNS servers.

That should be it.

If you look at your WinXP box and type 'ipconfig /all' you'll get the details from that
that you need to put onto the Falcon.

Alan.

Hi Djordje!

Can something compare to a solid ATARI screen (ANTIC preferably)?

No. Only when changing the TV-channel from AV to the Football World
Championship channel (ARD, ZDF, RTL). ...when will the Computer make
such pictures... :-)

Best Regards,

Daniel Mandic

Does anyone know if there was a difference between the US
and European spec Falcon power supplies?

Thanks

Ian.

Hi Ronald!

RJH> Can someone list the advantages over say, the EtherNEC?

- small PCB
- no need for additional ISA networking card
- USB for all Ataris (though probably quiet slow on 8 MHz ones)

I think that's quiet a lot of advantages ;-)

Regards,

Alexander

You mean, aside from the obvious voltage differences?

110 vs 220?

Theres always a problem introducing some new hardware. No one buys it because there is no software written, and no software is written because no one has the hardware.

The idea is, having network and USB intergrated on the same board it'll be handy for network primarily and with x amount of people having USB hardware to play with, hopefully some software will come about. I'm hoping this will also get Jan Thomas interestted in writing USB software once again.

I should be updating my website soon, new re-design and some info on a new project.

Lyndon

There are different models for Falcon
- Some are capable of auto adaptatation from 100 to 240 V...
- Some are not able of that and you have to verify it.

Hi,

Bit of trouble here and not sure what I'm doing..

1. ICD The Link (believed to be the L1, no led, grey)
2. Seagate ST32155N
3. IBM DORS-32160
4. Cumana SCSI1 enclosure with Matsui CD ROM
5. HDDRIVER 8.1 Demo
6. Centronics-50 terminator
7. Atari 4160STE TOS 1.6
8. ACSI extension cable

OK. HDDRIVER will recongnise the Cumana CD ROM on it's own, no problems, varying IDs, it sees it.

If I substitute the drives (2 && 3) then I don't see anything. Parity disabled. Now occasionally on the IBM when it's first plugged in HDDRIVER will just identify a bus number relating to the drive, and then it won't see it again.

I've tried lots of different combinations, plugging in the terminator, different IDs, TERM ON. And I'm getting no where. I can hot swap the CD ROM back in and it sees it. Have tried cold starts. You know how it is when you're trying everything.....

Any ideas?

Thanks kindly,

Alison

Even though you said you are sure that this is not a termination issue
the problem you have is typical for wrong termination, bad cables or
cables that are too long.
Your IBM drive is the one with 1 GB, isn't it? I once had such a drive
myself it it was very important to get anything right on the hardware
level. Otherwise strange things happened, like the drive sometimes just
not responding anymore etc.

I have a pile of drives here, sometimes they will list sometimes not, sometimes I can partition them, then the drive will vanish again. They all work perfectly on my Falcon but do not work on the ST. The only explinations are the drive is loading the cable somehow and its bordering on logic levels, or the link does not understand what the drive is. Use a older drive, I have a pile of seagate, they do not work. There are some other drives but do not work. I think its becasue its not really SCSI, its that RLL? interface.

Chris

Hi Uwe, thanks for replying,

The IBM drive... just checking. 2160MB

Options I have are;
JP1 - SPARE (50PIN) ID BIT 3 (FOR WIDE)
JP2 - ID BIT 2
JP3 - ID BIT 1
JP4 - ID BIT 0
JP5 - DISABLE AUTO SPIN
JP6 - SCSI TERM ON
JP7 - DISABLE UNIT ATTN
JP8 - SPARE
JP9 - AUTO START DELAY
JP10 - DELAY START 6/12
JP11 - DISABLE PARITY
JP12 - LED OUT

To be honest it's as if it doesn't communicate with the drive at all. With
the CD Rom it reports back model etc. With the IBM it reports that there's
something on the bus, say 0:1 for example and that's it.

First attempt I tried the following set;
JP3 - ID BIT 1
JP6 - SCSI TERM ON
JP11 - DISABLE PARITY

I've also tried it with JP6 clear.

Could it just be incompatiable drives or would you expect them to be
recognised?

Oh it's this one on the right by the way;

AFAIK, all secure sites use encryption.

In the UK, encryption is not illegal (yet!) but it is an offence not
to provide police etc. with the key if asked for - there has to be a
legally valid reason for this, probably a warrant. The law is targeted
on terrorists and paedophiles whose computer(s) may be sesized in a

raid. As an article in /The Times/ this Monday pointed out, as the penalty for not providing the key is lower than that for being caught with child pornography (2 and 10 years max respectively), many paedos won't divulge the key to cop a shorter sentence. The Governments proposal is to increase the max sentence for failing to provide the key.

Getting back to the original question, there is a version of PGP available for the Atari, which is pretty secure. The last version was 262I, I believe. It comes with some interesting DOCs about the problems the authors had in the US...

Regards, /Peter/

I used these on my old BBDP interface before I sent them to Alison. I think
they both 2 gig. They partitioned up fine with HD Driver 8.1 but as its an
old interface I could see 1 gig. I just set termination on the drives, and
did not use external termination. Now Alison has an ICD should she see 2
gigs. Will this confuse HD Driver?

Hi Dave :-)

I'm currently going through the comp.sys.atari.st archive on Google Groups
at the moment and am finding out loads.  The Seagate I have working in that
it's recognised fully by HDD, it isn't sure if it wants to power up though.
The IBM is still saying no.

At the moment I'm suspecting my enclosure is iffy or underpowered, it's only
got a little transformer in it which was driving a CD-ROM.

Not hugely desperate to do this asap so no rush here :)

It's really making me want to dive back into the CF project again as I don't
think I could bear the sound of another HD running.  The beauty of the ST is
that the only way you know it's on is from that LED on the bottom left of
the keyboard :)

That sounds plausible.... You might want to check the drive specs. The PSU I
use was bought at a Radio Rally about the time I bought the BBDP interface.
It gets very hot but it seesm to deliver the amps. I have two the same. One
runs the HDD iunterface and drive in one box. The other runs a 3.5 and 5.25
"floppy" drive enclosure. Don't laugh folks , at one time, when I had a
M6809 system I had 5" drives....

At another Radio Rally (This weekend) I saw IDE to CF for �10.00. I almost
bought one for my STE which at present has an IDEAL interface and 2.5" drive
so I think it could be fitted in niceley. I wonder if you could do SCSI =>
IDE => CF using one of these =>

http://www.span.com/catalog/product_info.php?products_id=1059

They are a bit on the expensive side, but if it worked you could have nice,
low power CF STs, TTs or MEGAS...

Er, really dumb question, but you're not using -both- are you? :)

Just making sure...

Also, lemme try to roughly sketch out how my setup works on my Mega ST
(the system that runs my BBS):

```
Mega ST -> ICD Link2 -> EZ135 -> 4 gig Seagate HD -> Plextor CDRW -> TERM.
      ASCI ID1          ID3          ID2                ID4
```

The hard drive and CDRW sit in a 2 bay enclosure with their own P/S.

I used to use the EZ135 (carts) for backup, but since CDs work so well on
Atari's with ExtenDOS, I just keep it in the chain now, to power the Link.
For some odd reason, the Link doesn't get the power it needs from the 2
bay case alone.

```

No, this does not matter. The second GB is simply not accessible if
there is no partition on it, but this is no problem.

Mathematics is not one of your strong points, yes?

=A37.99 starting bid (it's an auction, where as Alison is offering Buy
it now).

Assuming it sold at =A37.99 the cheapest postage is =A32 within the UK,
bringing a total to =A39.99

Yeah, o.k. a pound out. I'll go drink some coffee.

And I can see it's an auction, so it'll be interesting to see how much the
�7.99 starting
bid price actually goes for. We'll see in another 4 days time.

Alan.

I suppose, if you want to get technical, Bravo Sierra Computers isn't really an adoption agency, as adoption agencies typically don't sell their adoptees.   Perhaps Bravo Sierra Computers would be best described as an Atari Pet Store.   A place where you can buy your favourite Atari pets. Although it would probably be even more accurate to describe BSC as an Atari Humane Society -- A shelter unwanted and stray Atari computers and peripherals.

I suppose if you were feeling particularly insane, you could refer to a garbage bag as the Dr. Jack Kevourkian of Atari Computers.   And I suppose that would make garbage pickers radical activists that oppose euthanasia.

Hmmm, so what would that make Jack Tramiel?   A Doctor Morgentaler?   Yeah, I guess it would.   That would make Jack Tramiel the man that performed abortions on countless Atari computers in their first trimester.

Hmmm, following that logic, Nolan Bushnell would be the father that walked away from his bastard child before it was born. So Warner Communications would have been the single mother who raised the 400, 800, and XL machines on welfare before abandoning the children at the Tramiel orphanage.

Wow!   So dirty old Jack fathered the XEs and had a vasectomy.   So Jack Tramiel wouldn't have been the abortion doctor after all.   Rather, he was the man that decided XEs would be his only 8-bit children.

Crazy?   Yeah, but don't tell anyone.   It'll just be our little secret, okay?

His postage isn't tracked for one, so a negative there. I have the
experience of selling the things over the past year and in sorting out the
muddles when you have a heavily modded ST. He tells us practically nothing
about it.

If anyone wants to buy the parts of the remaining PeSTs, about 100 PCBs
(which are the expensive bit), then make me an offer.

I don't need this crap. If people want to thrash the price down until
they're left with things built as cheaply as possible then buy a Windows PC
and watch it crash all day.

Thx :)

Not hugely concerned really after thinking about it.  The aftersales here is
also included in the price and proven :)

Noted :) He can sell what he likes really. Bit of a lumpy old thing his is
anyway.

Am seriously going to start making his VGA adapters and start selling them.

I guess that though people would prefer lower prices they also accept that electronic devices produced in small series are moreless expensive. Your way of presenting PeST to the public, your helpfulness and the PeSTs reputation of being a quality piece of hardware should convince any Atari enthusiast. And I suppose that this can be read from your sales numbers and the feedback from your satisfied customers.

So keep on your good work and don't think Atari folks only decide with bargain buys in their minds.

Regards,

```

Hi Roy,

I recognise that name :)

What sort of cable would you like, as there's different sorts which can be done;

#1. Straight ST to VGA adapter. Cheapest. Simplest

#2. Straight ST to VGA cable. Less strain on the ST port, cable easy to get hold of

#3. ST to VGA cable. Potentiometers for RGB, allows mono display in any colour on screen.

#4. ST to 15 way D-Type, allows VGA or RGB monitor to connect with another lead. Eliminates any strain on the ST.

#5. Multisync box which plugs into #4. Allows a multisync monitor to work with mono and colour, switch toggled.

#6. Multisync box which plugs into #4. As per #3 which has the addition of any colour on screen in mono.

Well that's about it really. The price for something like #3 would be about the �20-25 mark.

Lots of options :)

Aly

Agreed. Trouble will Eiffels is that the use needs to pull the computer
apart.

To build Eiffels would definitely need fresh investment, a couple of hundred
� for the PCBs alone. Quite a bit more component hungery and more expensive
that PeST.

A few have been built here and boxed, did 3 actually, �50 each.

I think PeST is quite safe :)

:) There's a few more bits which I could do with the ST if I believed the potential demand was there;

#1. Full blown multisync monitor hookup/control boxes
#2. Floppy disk drive LCD display track counter
#3. SCSI host adapter (being mulled over at the moment)
#4. IDE ACSI interface/convertor (after 3, not as easy as it sounds)

Aly x

 #5. Multisync box which plugs into #4. Allows a multisync monitor to work
with mono and colour, switch toggled.

Probably the #5 and #4 setup if I can find a Multisync monitor, if not a
Multisync I would still have the mono capability..

Okay folks, the May 2006 winners are:

1. PEST mouse interface - Zeptari!

2. 1 mbit flash cart - almostrice!

3. ST Magazine - J_D!

4. Final Frontier II - None, game will continue this
                       month, with a $50 cash prize!

Congratulations to all our winners! :)

```
The June 2006 prizes are:

1. ST Magazine - 1 lucky Atari caller will win a free
                 3 magazine subscription!

2. Final Frontier II - game continues from last month,
                       cash prize now up to $50.00!

Good luck to all! :)

That sounds much better to me ;-)

t> #1. Full blown multisync monitor hookup/control boxes

Due to the lack of new low-frequency multisyncs I guess that simple
ST-VGA-adapters for b/w and (or combined with) ST-SCART-adapters for
colour were more widely usable. No idea what trickery "full blown ...
boxes" would include though...

t> #2. Floppy disk drive LCD display track counter

Nice gimmick. And that's the point, I'd expect not many of these would be sold. Though really a nice gimmick.

t> #3. SCSI host adapter (being mulled over at the moment)

THAT really is a long awaited project that surely will sell in big numbers. Think about the fact that it is fairly hard to get your hands on ICDs LINK2 adapters... On the other hand your product must be compatible to the LINK2 - or even more advanced. Nice features were configurable SCSI-ID for the "Host Adapter" itself and support for wide SCSI or even SAS, but that might be "too much" as well.

You should talk to Uwe Seimet about this.

t> #4. IDE ACSI interface/convertor

OK, that's the next step, but:

t> (after 3, not as easy as it sounds)

Here you're very right. You had to implement a controller executing the ACSI/SCSI commands and translating them into IDE signalling - AND to cope with masses of differently behaving devices. Not an easy task. And remember, there are SCSI->IDE converters available, not cheap but available. So if #3 was done you would re-open this way already...

Regards,

Alexander

The IDE/CF side is already done. It's the ACSI/SCSI side I still (note
still) need to get round to, a bit of can't be arsed being evident.

It wouldn't really be possible to surpass the ICD host adapters, just
maintain compatability. Not sure how fast I can process information though.
A 40Mhz microcontroller yeilds about 10million cycles flat out, and once you
factor in instructions taking more than one cycle, you're looking at about
2.5 million odd instructions per second. DMA limitation is about
1Mbyte/second so gives 2.5 instructions per byte there abouts. Moving onto
the ultra fast TQFP package microcontrollers brings new problems such as
soldering the things and track layout.

It is possible that it can can be used in all ST's. I am using one from the guy from New Zealand in my Hades.

It looks very much like one of these

http://members.aol.com/tgkirk/ps2mous.htm

but I can't see how you can make one of these for �5.99. I wonder of this
is "old stock"...

>
> Mmmm, I do wonder you know, as he says it's for ALL STs. Very dangerous

But they do all use the same mouse ports, so should work on all STs. In fact
the Keyboard interface is the same on all Atari's, appart from the actuall
motherboard connector which is why Eiffel's will work on any PC.

0) A SCSI Adaptor woiuld be a really usefull addition. I wonder if you could
do a box with hard drive interface and ethernea (ASCI => Ethernet)
in in the same box or on the same PCB. Not sure if ASCI passthru is needed.
Does any one still use old Atari laser printers?

1) As the Falcon has an IDE interface, what about an IDE interface for ST. I
know this is harder to make universal as it needs to go on the CPU bus and
Atari use a range of CPU types and sizes.

One trick way is to use STTOMSA on PC. This will convert ST format disks into Magic Shadow Archive files. You can split these over multiple floppies. You can then use MSA on the Atari to re-construct the disks. That way you write the disks on the ST and don't try and force the PC Floppy Controller to do unatural acts such as write oddly formatted sectors. You can get STTOMSA from :-

http://members.fortunecity.com/dahstra/atariarc.html <but scroll past the malware at the top down to MSA utilities.>

and MSA from

http://www.users.zetnet.co.uk/zogginhell/download.html

You need real DD floppies.

Yes that's what I'm thinking guessing from it's larger size. It's notably larger than PeST.

There's very subtle differences between the ST models, where most will recognise 250ms pulses and others 500ms. I think this is more to do with voltage drop more than anything else. 250ms obviously results in much more fluid mouse movement that 500ms, so the standard PeSTs are set at 390ms midway to take up most of the slack. There's the odd modified custom PeST out there which runs at 600ms.

In the beginning I swore that every ST keyboard sub system was the same, now with some experience behind me this isn't the case. Out of about 100 systems there's perhaps say 5 where the pulses PeST sends are misunderstood. Again, guessed to be voltage drop. Heavily modded STs with alot hooked up to the cartridge port, 16Mhz modded etc., can also have problems. You can have two STs both with the same mods, one will work and the other won't.

This guy if he starts selling these en-mass will become aware of this and will need the customer service skills (and time) to look after his buyers. PeST for example wasn't developed on one ST but a total of 5 different setups, 520STFM, 1040STF, 520STE, Mega STE (external keyboard), 520STFM (external TT keyboard). And despite that lot the odd system still pops up. PeST won't even talk to a particular Stacy I have in my inbox at the moment, mouse doesn't even initialise, works with all of his other STs though. That one's definitely summed up as a voltage drop issue as you can hook PeST straight up to 4.5v of AA batteries and it'll initialise (glows red) the mouse on it's own.

I entered this project thinking it was easy since the hardware was so standard, and then found out that 20 years after their release strange things are happening. Definitely an idea for PSUs to get their capacitors replaced in a few systems.

You need to find out if the designer is one and the same seller on
ebay. If not, then the seller is breaching copyright (assuming of
course he used this design).

Acknowledged.  The readme.txt reads;

"All files, programs etc contained in this archive are copright 2004 by Tom
Kirk. Personal use is allowed but any commercial use is not allowed. Please
feel free to use my work but don't rip me off."
```

To some extent it was because of these disclaimers (and number of parts) that we (Exxos & I) built PeST from scratch.

One of my spies had the following response from the seller;

"Hi
No.there are no parameters to be set up.It is as it says a ps2 mouse adapter for the atari.If you want to speed it up then you put a mouse accelerator in the auto folder or run the prg as you require"

Very helpful :)

I was just about to suggest weak PS until I read this last paragraph.

I know when I replaced the PS on the Mega ST that runs my BBS, several
things happened, floppy disk access sped up, the monitor display was very
noticably brighter, etc, etc,...

It's easy to forget sometimes, with Atari's as reliable as they are, that
we are running on approx. 20 year old hardware. :)

So My falcon didn't count as one then :-)

> I entered this project thinking it was easy since the hardware was so
> standard, and then found out that 20 years after their release strange

Some PSU's loose regulation and can actually rise in voltage also, this would upset some timings just as much as voltages sagging. Of course noisy lines will cause a whole bunch of other problems.. The ST is "clocking on a bit " :-)

Chris

Mulling it over this weekend, have been looking at case sizes available and what can be crammed into them.

I do have a true multisync monitor here... It's an NEC Multisync 3D and it does have the switch box with it I've mentioned up above. Plugs straight into the ST, with a toggle switch to go from mono to colour on the box. :)
If you're anywhere near Bury (which from memory I don't think you are) then you're welcome to it. Not sure it'd be practical to post, say about �25 with Parcelforce 48.

Monitor case is also yellowed too, it's hygenically clean though as all of
my systems go in a hot bath when I get them, and get cleaned with
toothpaste. :-)))

Toothpaste everyone!! You have to strip the equipment right down and put it
into 60oC water to soak until you can get your hands into the cooled down
water.

I'm good, but not that good :) Aside from having a life too :)

http://profiles.yahoo.com/alyssa_yc2000

The Atari is just a nice hobby really as 99% of the people are cheerful
enthusiasts :)

An IDE setup could be devised for ACSI, I've done the IDE side. Just needs
more time put into it and getting answers to a few questions I don't have,
Uwe knows of me that's for sure. ;-)

He appears!! :-) Everyone, Chris did the PCB design and electrical side of
PeST as well as us spending hours arguing which testing and developing it.

How practical would it be for us to recondition ST PSUs? Is it worth
writing up procedures? Which areas would need to be looked at? Is it just
a case of the electrolytics drying up? We could source and sell a
replacement caps set for the ST??

The caps dry ouy, voltage sag and causes ripple/voltage fluctuations. Its when the drive transistors start to go leaky that you loose the voltage regulation. You get all manner of nice faults, such as a 5V line when load with 1amp will rise to 5.1V, when loaded with 10amps, it can rise to 7V (talking general PSU's) Normally when loaded the voltage drops due to dry caps. Everyone already knows the rectifier dies sometimes taking out the choke with it. The ST PSU's are old. I do not think a "fix it kit" would be worth it, I sold on Ebay a box full of ST PSU's a while back for like a quid each... A lot of people can't solder so they wouldn't be able to do it themselves. I sometimes see ST's here which people send me for repair/updages though with the postage and services charges it doesn't always work out cost effective. I suppose you could offer replacement caps and transitors for them for a few quid, though do we really want people messing with stuff which plugs into the mains ? There are harcore fans out there which would send items to be repaired. Im sure theres a ST PSU repair guide out there somewhere already ?

Chris

I have downloaded the file tera382b.zip, unzipped and installed it, and it
works OK.

But it seems you have forgotten to update the content of your website:
this still only shows version 3.81

OK. How practical would it be to design a new PSU? As in the PCB, spec
components to go on the board etc. It's noted that the ST PSU is actually a
very old switch-mode PSU (I think) while the Amiga's is a solid lump of iron
(transformer).

The power being kicked out by some of these modern day laptop PSUs puts the
ST PSU to shame.

Best Electronics does sell a replacement PS. Its supposed to be better
than the original. Knowing Brad, I'm sure it is... Still a bit pricey
though.

No it was not TeraDesk's fault. It had something to do with dependancy.

I have Spectrum 512, but I have not heard of UniSpec.

Unispec is an upgrade for Spectrum 512.. It requires at least version 1.01 of spectrum.prg for merging. Unispec can be run as an acc. Requires 1MB machine to be used with another prg. Manual says it works with Neochrome, Degas, Degas Elite, Cad 3-D, Cyberpaint, Computer Eyes, Digispec and others. I assume like Spectrum 512, it can only be used on an 8mhz machine. Boot prg checks chip synchronizing.

I have Spectrum 512, Unispec, Computer Eyes(digitizer) & Digispec. Apparently I've forgotten almost as much as I knew about them. I think most

people would need the manual. It's 94 pages and refers back to the Spectrum
512 manual.

Well actually there is no real need for manual.

Typicaly if you want to use UniSpec with DegasElite, all you have do do is
to get the "spectrum 512" to run as a desk accessory (using unispec), then
when you run Degas Elite you can exchange data between the two programs.

I always considered Spectrum 512 as a magnificient piece of engieneering, but with a terrible ergonomy (programmers design at his best). In comparison Degas is slow, but way more practical to work with.

Associating the two programs makes it possible to draw (for example) "sprites" or shapes in 16 colors using the comfortable tools of Degelite, then you select them as blocks, and you go back to the main gem interface, and in the deskaccessory you have one line with various acronyms, depending of where you click spectrum will intercept the command, for example "import the current degas elite block as a block in spectrum 512". Then the control is transfered to spectrum and you can move the block.

One particular usage of this is compositing, ie the creation of 512 colors pictures using copy-pasting of 16 colors items.

: You could also add that the monitors for the ST give a much clearer picture
: than the ones for the Amiga. I admit I have never seen an Amiga monitor, but
: this is something I have heard for years...

Ancient history: The internals, and the mounting surface, of the
monochrome monitor were the same as those of the mono monitors used for
NCR banking machines. The mounts for those machines fit, if you can get
the part number, which apparently can be done in Germany.

Same for the color monitors. The externals varied a bit, but the workings
and mountings were also found on NCR bank machines.

I learned most of this in the process of getting a mono monitor tube
regunned by a tube rebuilder.

if you prefer MiNT instead of Magic; did you try a recent FreeMiNT 1.16.x
with XaAES kernel module ? I think in the current state XaAES has
surpassed N.AES 2.0.

Hi,

Yes, I have mint 1.16.3 and 1.15.12. I have tried with Odd to install
XaAES but it's not simply for me, and I have cancelled this project...

It's the reason why I have N.AES 2 with Mint 1.16.3.

Thanks for your answer,

Cyril.

It all depends on the definition of "faster". Raw CPU power was
somewhere around 90% compared to that of an ST. On the other hand, the

Amiga could play sampled multichannel sound and move stuff around on
the screen without using any CPU time at all. We had to do all this
using the CPU, causing lower framerates, bad sound, jerky scrolling,
less colours...

I'd say the fun started with the F030.

btw, I have all the Speccies I need :-) 48k, 128k, +3, Beckman 2000
(rare Swedish speccy clone thingy with better keyboard. Standard 48k +
swedish ROM inside.)

"Hold And Modify" was pretty good. For pictures. Not very good at anything
else though.

Spectrum 512, PhotoChrome and other paint packages, using software
"tricks" did the same thing for the ST... 512 colors and up, onscreen at
one time.

What is the arrangement with SCSI hard drives and the Atari ST? I've just acquired an ICD LINK adapter and am trawling the web at the moment for lowish GB SCSI1 50-pin drives.

The Seagates seem to come out top as there's specifically a 'parity' jumper on them.

Can 68pin or 80pin drives be used with an adapter, or does the 16bit transfers create an issue?

Would it be possible for someone to give me an idea of what I'm looking for? As trawling eBay at the moment I can pick up plenty of these Compaq ultrawide drive pulls, assuming they have a SCSI1 mode and can perform 8 bit transfers.

The ICD Link btw will recognise my SCSI Cumana (was for Acorn BBC Archimedes) drive, so is assumed to be functional.

Thanks kindly in advance,

Aly

Greetings all,

I picked up from a packrat the other day (3) Supra External Drive kits that use SCSI drives and have 20MB drives in them. These plug directly into the HD port in the back of a 520/1040ST and allow you to get away from the floppy disk.

Asking $30/each for them.

Drop a line to ataristuff (at) 00100100.net for arrangements. Will ship anywhere except Nigeria for the obvious reasons of phishing.

-D

I've successfully used a SCA 80pin to 50 pin adapter with my Atari TT030 and
a Seagate ST34572WC drive.

A couple of others didn't even get recognized, like a Quantum & DEC.

I've also used an IBM DCHS drive too.

Alan.

No, there are no issues to be expected, you just need an adapter.

> ultrawide drive pulls, assuming they have a SCSI1 mode and can perform 8 bit

Any 16-bit SCSI drive should support 8-bit transfers.

I am not sure of the Link supports SCSI command passthrough. If it does then almost any SCSI drive should work. However I suggest that you get a copy of HD-Driver. I have a TT-030 which has a built in SCSI adaptor. I have a pile of (8 I think) 1 and 2Gbyte SCSI drives next to it. I also have copies of several version of AHDI, CBHD and HD Driver.All the SCSI disks in the pile work on a PC with an Adaptec SCSI adaptor.

However on my TT only HD Driver works correctly with most of the drives. AHDI almost always sees the drive, and appears to format them.. But it won't ever create a partition. CBHD sometimes creates a partition but then manages to corrupt the data. After all this messing around I began to think my TT was duff. However I managed to create a partition with CBHD and the demo version of HD Driver then accessed this flawlessly. So I bought a copy of HD Driver and all seesm great. I must admit I don't use the thing very often these days....

> The ICD Link btw will recognise my SCSI Cumana (was for Acorn BBC
> Archimedes) drive, so is assumed to be functional.

I would think so. Would you like some samples from my pile of SCSI drives. If you want I'll format a couple up with HD Driver (but not install the driver) so you may then be able to access it with the demo version...

> Thanks kindly in advance,

Thats O.K.

> Aly

Folks,
As I need to create space in my micro sized computer room, sadly I have one or two ATARI bits that are going to have to go:-

1) MEGA ST2
Original MEGA ST-2. and keyboard. Sorry no SM124 that died some time ago.
Internal floppy is single sided. See below for extras.
Not sure if I have a working mouse:-(

2) Ethernec and RTL card. Built and supplied by Lyndon

3) External cumana floppy drive. (came with Mega)

4) SCSI Ethernet adaptor.
Only works with STING and real SCSI port. Tested on my TT.
Needs 12v PSU

5) external home brew Hard Drive (BBDP interface I think it has a 60Meg Drive),
Works but looks a right mess :-(

Also have box of original START disks plus some games,

I assume the above work, but I have not used for ages so will test before dispatch....

Any offers considered. Would prefer buyers collect. If I get lots of offers (some hope I Know) I reserve the right to E-Bay it as I think that would be the fairest way to dispose of it....

Dave.

Yes, HDX is known for often reporting that it could not write the root sector, and in this case it is impossible to create a partition. But even if AHDI were able to partition a drive one would not have much fun with drives bigger than 1 GB because AHDI cannot access more than the first GB of a SCSI drive. AHDI does not know/use the SCSI commands required for accessing sectors beyond the first GB.

> I would think so. Would you like some samples from my pile of SCSI drives.

Note that formatting a drive is never required if a drive does not have
bad sectors. Depending on the drive formatting can take a long time.
Partitioning a drive is always sufficient, even if it was previously
used with another platform, because partitioning creates new filesystems
and simply overwrites any old stuff.

```

And its so long since I ran this I am thinking in PC terms where FDISK only
creates the entry in the partition table, then you do need a "high level
format" to build the empty file system, rather than a low level format as
done by the ST utilities....

You do not have to test for bad sectors unless TOS (i.e. the driver)
reports them. SCSI drives, in particular, manage bad sectors on their
own without your noticing it, and they automatically replace bad sectors
by spare sectors.

Correct,

I found out that the later version did not require the dongle.
I have 2 versions, 1 that uses the dongle and 1 that does not.

Definitely wouldn't say no to some SCSI drives to play with :) Ideally like
to start small and with 50-pin.

Name your price :) Is PayPal ok for you? No problems with postal orders
either :)

Aly

Uwe,
 Having just spent a lot of time sorting out a dead hard drive on my pc,
albeit an IDE one, I hope TOS does better reporting of bad sectors than
windows :-(
Dave.

1) PayPal is fine.
2) Let me test a couple and work out the postage. Do you have an e-mail?

Version 3.82 of TeraDesk open-source desktop is available at:

http://solair.eunet.yu/~vdjole/teradesk.htm

Functionality of some features was improved, several bugs were fixed and the hypertext manual updated.

See the history file for more information.

Have fun.

Just tested Teradesk 3.82, but the problem with moving of Teradesk's
windows is still present under MagiC-PC I am afraid.

Regards,

/Joakim

> windows :-(

TOS (actually the hard disk driver by having TOS display the error
message) reports an error as soon as the hard disk drive reports it to
the driver.

If i remember correctly all you have to do is rename the powerup2.prg
to something like :

powerup2off.prg to switch it off

```
powerup2on.prg or powerup2.prg to switch it on

I had Stoop (boot manager) to do this for me and never used the CPX

I had a led to tell me if it was on or off and i could run the powerup2
program without rebooting. Gives about 10% increase in general as it
has no bus speed improvement just CPU 'overclocking'

My vote goes to Stoop. I can't remember whether it's a Falcon only boot manager though?

I have lots of files on the PC with a .ST extension and I want to transfer them to floppies. Is there a way to put the floppy in Atari, which is connected with PC in some way (I have a null-modem cable), and use some program to write the image byte by byte to Atari onto its floppy drive?
I used wfdcopy with PC floppy drive but it was unreliable, throwing some errors, bad sectors etc. Floppies were HD with hole taped over to make

them DD. Probably troubles with PC drive. I had some DD floppies but I got the same results.

A friend of mine has had his hard drive die inside of his ST Book. There's a few questions that I hope some experts here may be able to answer.

Do you know by chance if the format of the drive is the same as the regular ST or if it is the same as the TT/Falcon?
Since the drive is IDE, can any drive be used in it or does it require certain models?
What means will the drive need to be formatted and with what software is recommended?

Appreciate help anyone can give to answering these questions.

Regards,
Glenn Bruner
glenn.bruner@verizon.net

Dooes the ST have a HD. If so, use StarCall on the ST, a Null modem cable and a Telcom program for the PC. You can also use Ghostlink for the ST which is designed to work with the ST using a Null Modem cable. If you cannot find it, email me and I will email it to you.

Hell everyone,

Well I have Mint up and running including X11. Now all I need is to get my EtherNet card working. I have the driver from Ozk and it works fine under MagicNet, but I just cannot seem to get it working under Mintnet. The first time I tried it, it worked fine but for some reason I cannot get connected. I know I need to run the PCI_BIOS program. I have that boot up before the Mint Program. Everything loads and then I get to a point where it says: "loading interfaces" and then nothing. Just in the boot process is everyone else putting the PCI_BIOS program? Also, MagicNet also requires me to rename the PCI_BIOS.prg to PCI_BIOS.DEV and put it into the Xtension folder.

Another question is about memory protection. I have tried to use it and I am not told (in the booting process) it cannot be done. I would think it was some program I was trying to boot that is causing the conflict.

Anyone have any suggestions/comments?

Hello again,

I just noticed I type "Hell" at the beginning. Sorry, it was a mistake. I just wanted to mention that I partially solved my Internet connection problem. I found told files (drivers for my Ethernet card) that I believe Ozk had specially made for me. When I used them everything worked to a point. I can now ping my computer, the router and my wife's PC. I just cannot get out into the Internet. I am tweaking things to see if I can solve the problem.

Hello all Atari fans!

Just to let you know a new website and ebay shop is coming soon (July 1st 2006) and will feature Atari news, reviews and even original retro games in the ebay shop!

To be informed of updates and to be one of the first to join you can sign up for the Focus Gaming (UK) mailing list. Your email address will be only used by us and not by any third parties.

The website will feature reviews, news, forum, classic TV ads, games and much more on 8-Bit, 16-Bit, 32-Bit consoles and computers. Also an ebay shop to buy original copies of games and hardware.

Sign up today at http://www.focusgaming.co.uk

Any views, ideas, messages of support :(

And this being mine;

http://cgi.ebay.co.uk/ws/eBayISAPI.dll?ViewItem&item=8814786603

Bugger!! :(

Mmmm, I do wonder you know, as he says it's for ALL STs. Very dangerous thing to say that is when I know that there are differences between the different STs.

Help!

I think I know what I'm going to do, I'm going to start selling his ST>VGA adapters that he's enjoyed selling. Yes, that is what I shall do. I shall buy in the parts to make about 100 and flood the market with them.

Hell hath no fury...

Ever heard of copyright laws?? Prove you thought of it first and he hasn't a leg to stand on! I guess you didn't patent your creation either?!?

Bought mine from you and have no complaints whatsoever. Works perfectly on my STe even with an optical PS2 mouse.

Chin up

I would also feel agreeved in your position, however as Patents are not cost effective for new Atari related products and Copyright largely pertains to written products and images it is probably too expensive and too much hassle to get anything done about it unless you really really feel strongly about it in which case talk to a solicitor as you may have a case under the "passing off" clause. If a solicitor does feel you have a case under passing off a strongly worded solicitors letter threatening to take action might make him stop selling them or agree to give you a percentage as a form of compensation for your loss of sales but that is probably about all you can do.

>Well now I found out the problem. It is not MintNet it is the Thing desktop.
>When I load in Jinnee I can display all the files in question, but when Thing
>is up I cannot as it reports the file names are too long. Any Thing experts
>out there. What is the latest version. I am using 1.27.

1.27 was the last released version (though 1.29 was announced as a beta and reputedly available for download, though I never managed to get it). 1.27 accepts filenames up to at least 33 characters long (before the point) on the desktop, and permits spaces. However it will not take that length in the 'Show Info' dialog. For longer names, use jinnee, which permits 64 character filenames.

Regards, /Peter/

Pagestream is still around for pretty much everything except the Atari
-- http://www.pagestream.org/ .

I just purchased an iBook yesterday to replace my aging Powerbook
3400c, and I'm pondering whether to purchase Pagestream 5. I have been
told by customer service that PG 5 can import Atari PG 2.2 formatted
files.

Has anyone else here used PG 4 or 5?

Galen (who played Towers with his son yesterday using dual Falcon 030s)

>Well is the author working on this?

Well, contrary to what some people seem to think, I'm not a psychic.
It's usually best to actually tell me about problems rather than to
just assume that I will learn about them by magic. ;-)
(I fixed a bug concerning 32+ open virtual workstations just a
 couple of days ago after being told about the issue.)

Anyway, it does indeed sound very likely that the culprit here is
fVDI. Probably an effect of the currently somewhat limited support
for the NVDIv5 blit functions.

Could you tell me in more detail how this problem occurs?
Can I find a downloadable demo of the relevant desktop program?
Is it a problem with all colour images, or only non-bitplane ones?
Does it occur in all screen modes? Only bitplane? Only true colour?
Any debug output from fVDI? Even without normal debug output turned
on, it is supposed to diagnose vr_transfer_bits problems. You might
need to redirect the output to some suitable place to see it, though.

Even if you chose to continue this discussion here, I'd appreciate
if you sent me an email (johan@klockars.net). I don't look in on
c.s.a.st as often as I perhaps should these days.

What was the matter with that particular file, i.e. in wat way did
it differ from other files so that TeraDesk could not handle it
(if it was TeraDesk's fault at all)?

Btw. TeraDesk accepts filenames up to 127 characters long (complete paths
up to 255 characters), including spaces and quotes.

However, desktop icons in TeraDesk can have labels only 12 characters long,
so such filenames are severely shortened when displayed on the desktop
(middle parts of names replaced with "...").

I have a question about PAL and NTSC games :

Will PAL games work on NTSC machines?

What about games which use the higher
PAL resolution, that means opened borders
or something like sync scrolling?

I know that NTSC games work on PAL machines.
Some do switch to 60Hz, but that's no big deal
when you have an SC1224 or some RGB monitor.

I have put up for auction on ebay a Spectre GCR (Macintosh emulator for
the Atari ST), including the 128k Mac ROMs and all documentation/software.

Item #8815815083
http://cm.ebay.com/cm/ck/1065-29296-2357-0?
uid=40782990&site=0&ver=LCA080805&item=8815815083&lk=URL

I also have the following for sale in Dallas, TX, USA. If you're
interested, let me know if you have any questions, or make an offer and
we can discuss shipping. :) I can email pictures if desired. I will be
putting these items on ebay as well within the next couple of weeks.

- 520 ST
  Rainbow TOS 1.04
  AERCO easieST RAM upgrade, 2.5MB RAM total RAM
  Has a couple of broken keys on the keyboard

- MEGA ST4
  TOS 1.02
  4MB RAM
  Includes working keyboard

- SM124 Mono Monitor

- SC1224 Color Monitor

- Hard disk enclosure with ICD adSCSI-Plus SCSI host adapter, 44MB Syquest removable drive (incl. 2 disks) and 80MB hard drive
(I also have a non-working ICD Advantage-Plus SCSI host adapter - which AFAIK is an older version of the above but functionally the same. It was working when I first pulled all this out of the boxes, but I seem to have broken it. :(After initial successful testing, it started causing the Atari to bomb during bootup.)

- Two functional Atari ST mice

Please direct any replies or questions to "mbrunt at yahoo.com". Thank you very much!

Micah Brunt

I just tried loading 16 and 256 colours images and without debug
on I get this from fVDI beta 7:

v_get_ctab_id not yet supported

Since I'm the one who first mentioned the fact that Jinnee doesn't display
colour images under fVDI, I'l take a closer look and mail you with a
more complete bug report. I haven't bothered you with that since it is
not very important to me.

And yes, a demo version of Jinnee can be downloaded from ASH's website:

http://www.application-systems.de/jinnee/index.html

Unfortunately I don't have 1.29, even though I worked with Thomas
in translating previous RSCs. If someone were kind enough to mail
the package to me, I'll see what I can do.

Regards, /Peter/

Hi again,

Today the Swedish Atari Club posted additional information regarding the upcoming event on their website. Nordic Atari Show 2006 is the Swedish Atari Users Association's annual convention which consist an excellent opportunity for all Atari entusiasts to get together, make new friends and make developement progress, and of course, have a great time!

The theme for NAS will be CT60, EtherNAT, FreeMiNT and XaAES. If it will be anything like last year, we should be able to expect several CT60's in action. Developers of EtherNAT (Nature) and XaAES (Ozk) will be present, as will Nick Harlow of 16/32 Systems.

NAS will be open from June 30 6pm to July 2 3pm. If you just like to visit NAS without bringing any equipment the best times will be from 10am to 7pm on saturday and 10am to 2pm on sunday.

* To review all the details about NAS2006, please visit the official NAS-website

http://www.sak.nu/nas/index.htm

* To see which ppl that are planning on going to NAS, and to view pictures from previous NAS events:

http://nas.atari.org

Regards,

The answer is yes ... (usually at least).

I have several games I purchased mail order from England.  (I'm in the
USA.)  They all work on my STe/SC1224 combination, since the monitor
can switch to 50 Hz.  (Unfortunately, I can see a flicker at 50 Hz, but
it isn't too bad -- your eyesight may vary.)  On the other hand, I
don't know if all PAL games can be so played.  It could be that all the
ones I purchased were intentionally written to be compatible.

Galen

I'm an evil usenet troll, but the netcops are chasing me and PCs with
all
that spyware are no good to troll the usenet anonymously.

So can I use the ATARI ST to troll the usenet without being caught
by those nasty netcops? You know, netcops are gay and they'll
do kinky stuff with me if they ever get me.

Can I use anonymous proxies with an ATARI ST and modify
my Browser informatioin, too?

All,

At one point I was the caretaker of the Suburban Chicago ATari public domain software. In order to save space, I stored all the files on a QIC-150 using tarfile format (created with MiNT).

Anyway, I no longer have an Atari, SCAT no longer exists, and I don't want to just pitch the tape. Anyone in the DFW (Texas) area who wants it can pick it up. I'll ship it for shipping costs.

BTW, I haven't looked at this tape in a while as I no longer have a QIC-150 drive (otherwise I guess I could just upload it). So buyer (or picker-upper) beware.

Email or 817-427-2129.

Thanks.

Well, I was wondering about that! I just figured maybe you guys had went
belly-up recently, but I'm glad to see you're still around. :-)

Hopefully, since SCAT really isn't defunct, maybe they can put the
collection online for everyone.

They do now with fVDI as well (I've only tested 32 bit mode, but the rest should work too). :-)

>> fVDI. Probably an effect of the currently somewhat limited support
>> for the NVDIv5 blit functions.

I turned out that Jinnee didn't use the NVDIv5 blit functions after all (but it did use vq_ctab, which I had forgotten to finish up).

The main problem was that Jinnee used plain old vrt_cpyfm (mono expand blit) in a somewhat strange way to convert the background image to something that could easily be blitted to the screen.
I'd forgotten to check for non-screen destination in that function (vro_cpyfm has done that for a very long time), so it clipped against the clipping rectangle even when the destination was ordinary memory rather than the screen (which may sound reasonable, but it's not supposed to do that).

>I just tried loading 16 and 256 colours images and without debug
>on I get this from fVDI beta 7:
>
>v_get_ctab_id not yet supported

That function is indeed not implemented yet, but it shouldn't really matter in non-paletted screen modes (it is apparently meant to be used to let you know if the palette has changed).

>Since I'm the one who first mentioned the fact that Jinnee doesn't display
>colour images under fVDI, I'l take a closer look and mail you with a

No need. It seems to work fine now. :-)
Just download the latest FVDI.PRG from my web site.

i will state very clearly ...."NO IT DOES NOT"
if it becomes trendy  you will be the first to know.
yes please write some drivers too.

signed the man against exploitation of atari computer.
c.c.

maybe just pictures of the amiga  will be found more stimulating.

ha,ha,ha.laughing ....penis in the atari , the thing is only like a inch and
a bit think anyhow..

Several manufacturers made RGB cables for ATARI XL/C 64 and AMIGA. I have both. Makes an excellent picture with my XL....

Audio can be connected even better and easier, via cinch. Although, that cable-replicas for the mighty AMIGA are including cinch-connectors L-R! That means Audio via Scart.

Best Regards,

Daniel Mandic

Oh yes, the OS-Disks. Why not?

Mine were/are also with ROM onboard, although the ST/TT made the race
so far. One remaining :), I still like to play.

Best Regards,

Daniel Mandic

Hi all,

WIth N.AES 2.0, I have a problem with Novascan. Black and white scan is ok, but grey and colour scan not work correctly. I have a strange image. With MagiC and MyAeS, it's ok. An idee ?

Thanks a lot,

Cyril.

Too bad!? Are you kidding me? He's still in business - which is a good thing!
Ask the dude nicely and he'll give it to you (if you've registered v.1.27).

Try the right address. I repeat - try the right address. He's on the mintlist.

One more thing - if you people want this stuff to be free - try to convince the author to release it under GPL.

regards

```

AFAIK, I did asked him nicely a copy of Thing 1.29 and yes I'm a
```

registrated user of Thing 1.27
>
> Try the right address. I repeat - try the right address. He's on the

I did use the address as found in the mintlist not that long ago but as
said before he never replied to me.

I don't care at all if I've to pay for it. It's a nice and very useful
piece of soft for which I would happely pay a fair amount of money for it.
But as the author doesn't answer too me ...

Kind regards,

Martin

When was that? Last time I contacted him was in January, I think. I
used the gryf@... ... address. Complete address can be found here:
http://atari.transaction.free.fr/interactive/authors/binder.htm

> But as the author doesn't answer too me ...

... still doesn't allow anyone to distribute it without his approval.

lol :-)

10 reasons why my spectrum is better than the ST:
```

1. It's black
2. It's got rubber keys
3. It's got a separate PSU.
4. It's got a built-in speaker
5. It has a direct-CPU expansion slot
6. It's tape-recorder-compatible
7. Memory arrangement is straight forward unlike ST/TT-ram
8. Built-in basic
9. Doesn't require a mouse
10. The speccy key-click is nicer than the atari-bip

Well.. seriously. Don't get me wrong. I like the Atari line of computers. I have a F030/CT60 and a Hades which I use every day. However, to be honest - the Amiga 500 hardware was far more technically advanced than the 520ST/STE was, in allmost every aspect. I could never admit that at the time, however...

Hmm, I've got 2 slighty different addresses like that - I know he did send me the registration key just last year on one of them (I had registered years ago, but lost my key - fortunately, Thomas remembered, and still had me in his database), but I'm not sure now which one?

Here they are:

g<SPAM>ryf@hr<BLOCK>z.th-darm<REM_OVE>stadt.d*HERE*e
gr<REMOVE>yf@hrz<SP_AM>pub.tu-darm<BLOCK>stadt.d*THERE*e

Not in MIDI. Nothing can compare to a ST, only humans... due to more individual play - in meaning of dual. ;-)

Games on ST are also O.K. (Dungeon Master, Chaos strikes back, Elite, Bloodwych, Bard's Tale, Kaiser, Bitmap Brothers)

I think many know the advantages of either System.

Best Regards,

Daniel Mandic

Wouldn't like to buy one would you?? I have a 16k one boxed, immaculate, and purchase complete. Would throw in a 32k rampack, Ram Turbo interface, a Competition Pro joystick, JetPac, JetMan, Atic Atac.

About �40 for that lot including postage via insured courier.

Also a 128k+ (heatsink one) which is boxed and purchase complete too, with say Ram Turbo interface, Nodes of Yesod, Robin of the Wood. That one I'm likely holding onto though :(

But the speccy is brilliant. Back to the Amiga, I just don't like the feel of the thing, technologically advanced or not. Admittedly the Ammie board is quite bare compared to the STs. Oh and the ST ran faster ;-)

You could also add that the monitors for the ST give a much clearer picture
than the ones for the Amiga. I admit I have never seen an Amiga monitor, but
this is something I have heard for years...

Hmm, just tried out Jinnee in 24 bit mode. The colors were ok. Under
32 bit mode only the desktop icons were screwed up. The desktop

background picture, menu's etc ... are good.
I don't know if it makes any differents but I'm using XaAES 0.998
instead of N_AES 2.0. I stopped using N_AES since quite some time now.

```

Folks, we've got 13 player slots left in Final Frontier 2. The game is
progressing slowly, so it will probably extend into next month. So I'll
add another $25 for a total of $50 then, as the cash prize for the winner.

Watch out for the Satharians! (computer AI). They've already found me
twice in the deep recessess of space and slagged me. (curse them and
consign them to the netherworlds!). :)

Phew, what a relieve.;-) I thought I was the last Thing 1.27 user in
Atari land. I was already thinking about to ask the status of serious
endangered species.

I wonder how we can persuade Thomas Binder to release Thing 1.29.

I hate to say this, but since many people have tried and failed to
contact Thomas then the answer must be that this must be considered
"abandon ware"?

Hmm, even better yet, is if we could get him to "touch it up" and then release it?

I recently moved to a village near Ely, Cambs and sitting in the garage is
my old Atari ST.

I've not use it in years but have no use for it now.

I'm willing to let someone have it at no cost if collected or a short way if
I deliver it, say 50 miles(ish) from Ely.

It's a Atari STFM520 with a 4Mb upgrade internal. Single-sided Floppy drive.
Mono SM124 monitor + Philips 14" colour monitor with a monitor switcher
attached.
I've also got 3 large boxes of programs, games etc, Calligrapher etc.
A handheld B&W scanner too. A few books also.

If there is anyone that would give it a good home then please email me.
But take out the "nospam." from the email address.

Steve Clark

Hi
    I really appreciate this Rustynutt. Does this also turn off PowerUp2?

On the TT version there is also a seperate program to turn PowerUp off &
a cpx utility as well.So it looks like I'm looking for the prog to turn
Powerup2 off, the cpx utility and some docs if possible. So far so very
good.

regards
Maurice

I tried out TetraDesk in the EasyMint installation and it worked fine. I think
 there was only one file that did not install.

You really must do that some time. You won't regret it. Sure there are
some issues that needs to be solved but XaAES as it is today is very useful.

I really don't have any reason at all to return to N_AES.

TTFN

I concur with Martin and indeed use Jinnee with XaAES and it works perfectly well except for the lack of backgroud images. But this may be due to fVDI.

Cheers,
JFL

Hmm, you can't use background images with Jinnee?

Well, thats certainly a bummer. Seems like all modern desktops should
support that.

So Thing and Neodesk are the only Atari desktops that support background
images/wallpaper?

I have no problem using background images with Jinnee on my Hades, in 256
colours, which is what I use all the time.

Cheers

Paul

Hello,

SDL 1.2.10 was officially released this week. New and fixed stuff:
- Added unicode character code support in keyboard drivers.
- Keyboard/mouse management with XBIOS interrupt disabled under MiNT (can cause crashes).
- Added driver for /dev/mouse in MiNT, but disabled at the moment (not usable with other applications at the same time).
- Updated for mintlib 0.57.6.

And for the first time, I also ported some other SDL helper libraries:
- SDL_mixer 1.2.7 (for music and sound replay)
- SDL_image 1.2.5 (for image loading)
- SDL_net 1.2.6 (for network)
- SDL_ttf 2.0.8 (for truetype fonts)

Everything is available on my website now.

It appears I wasn't clear? I was stating in the other post that with XaAES/fVDI
background images weren't displaying right. I've never said Jinnee
couldn't do them at all. We were talking about XaAES "issues" versus NAES.

Cheers,
JFL

Pardon me, that was my fault. Thanks for clearing that up.

Probably yes. Jinnee does display background images on my Hades using
novaVDI

CU,
Martin.

Derryck,

Thing is IMHO *not* abandonware. I emailed the author some time ago
(approx 3 months) and he replied right away. People must be using the
wrong address or something.

Hi,

It's probably fVDI. Background images works w.o. problems (Hades,
Xaaes, 8bpp screenmode, NVDI).

I have up for auction on ebay my Atari collection.

This auction is for an Atari ST collection. Everything is sold as is,
but is in good working and cosmetic condition.
The collection contains the following items:

- Atari 1040ST computer
- Atari SH204 hard disk drive (20 MB, I believe)
- Atari SM124 Monochrome Monitor (bright and crisp)
- Atari SC1224 Color Monitor (bright and crisp)
- Monitor Master A-B switch to select between the monichrome and color monitors
- Atari two button mouse
- Atari joystick (not pictured)
- Over 110 3.5" floppy disks worth of programs
- STation (a support for the monitors and also to house the drives)
- Spectre GCR Magic Sac Macintosh emulator

Here is the URL:

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=8815716181&rd=1&sspagename=STRK%3AMESE%3AIT&rd=1

Email

me with any questions you may have.

Hi Jean-Francois!

> It appears I wasn't clear? I was stating in the other post that with XaAES/fVDI
> background images weren't displaying right. I've never said Jinnee
> couldn't do them at all. We were talking about XaAES "issues" versus NAES.

And that is still not clear:

I do use jinnee + XaAES on a Milan and on aranym.

Milan: background images nice and fine
aranym: background images do not work

The only software difference in the 2 setups is the VDI. On Milan it is NVDI, on aranym fvdi.

Now it is clear whose fault it is.

Of course jinnee can do background images! It even has some cool

feature, that you can
a) use a background pattern
b) use a picture (on top of the pattern)
c) use a mask for the picture

So clearly, jinnee is very decent with background images!

Cheers, Ingo =;->

If Peter comes to the Cheshunt Computer Club meeting on Wednesday I'll ask him if he has already translated this - if he hasn't, then you could use the English resource from an earlier version to edit this one.

Hi
Thanks for your help.
I've checked the TT cpx utility it seems to work. Also now have a TTP prog
to switch it off. So that's that sorted.
Had a dabble accessing the internet with CAB last night - very nice,
although
speed is best described as sedate even with the acceleration.

cheers
Maurice

I use NVDI. Can this be used with XaAES? I surely hope so and if it does I am sure Jinnee backgroup images will be no problem.

That may be the case under XaAes, but under NVDI you can also use the Ease desktop and Jinnie with back background images.

Too bad. Seems he should release the last Beta now (version 1.29). Or can I
give it out since he abandoned it?

Having bought an Amiga A500 to further develop PeST with, here's my
observations;

1. The ST's PSU is internal, the Amiga's isn't.
2. The Amiga has no reset switch.
3. The Amiga has a box to connect to for TV out, then you need more leads.

4. ST FDD is 1/2 height, Amiga's is 1/3 height.
5. Amiga uses hex screws to get into it, ST doesn't.
6. Metal shielding in ST is thicker, Amiga shielding is deadly sharp!! :(
7. Amiga yellows more severely than the ST.
8. ST is neater in design.
9. Strange memory arrangment on the Amiga, chip ram, real ram!!, i don't know??
10. Workbench 1.3 boot disk is STILL copyrighted!!
11. Amiga disks can't be interchanged with a PC without gizmos

So I have an A500 with no Workbench/Kickstart disks such that I can't do anything with it. You can't even get images of the things off the net, and if you could, you couldn't put them to disk.

Sorry to say it but the Amiga get's the thumbs down, I want to throw this thing in the bin it's so frustratingly awkward.

If I didn't know better I'd say it was a commercial copy of an ST. The ST has a much nicer corporate feel to it. The Amiga is for children to play with.

You could recycle it, at least.

> If I didn't know better I'd say it was a commercial copy of an ST.
> The ST has a much nicer corporate feel to it. The Amiga is for

The most famous word I have ever/always heard about the AMIGA, is the mentioning of the famous graphic capabilities. And that famous Gfx is the same generation, who made the ATARI 400/800 famous, and the mighty VCS. XL. XE (already Tramiels) ... and so on. 260ST, 520, 1040 etc...

Best Regards,

```

The dongle was for copy protection on early releases of DynaCADD. It
was abandoned on later releases, I believe -- at least its not needed
on the version I'm still using on my trusty 'ol TT030 (vers. 2.04.06).
As I recall, the dongle plugged into one of the serial ports, but
check your documentation to be sure.

I did use the address as found on the mintlist some time ago.
For some dark reasons he seems to ignore me.

Can it be he only sends a copy to software developers?

Im hardly seeking one interesting programm for ATARI ST. Anybody ever heard
about UniSpec, a succesor of Spectrum 512 graphic editor?

Maybe somebody still got this stuff?

Thanks in advance for any infos.

I'm no software developer to speak of and Thomas replied when I contacted him
a couple of months ago at the address he uses on the MiNTlist. Maybe you weren't
polite with him? :-)

If he reads this thread he must find this discussion rather amusing.

Hmm, who knows but if so this was certainly not on purpose. English is
not my mothertongue and my poor knowledge of English is not always
sufficient enough to express me properly.
>
> If he reads this thread he must find this discussion rather amusing.

I hope he finds it amusing.

And so did I. I paid for the regular Thing version and I paid twice for the N_AES version.

Not sure but I believe I got the registration key from InterActive (Joe Connor).

Hey. Have you tried running the program? For some reason, deep within the (admittedly foggy) recesses of my mind, I'm thinking thats a dongle for copy protection. That if its not plugged in, the software won't run.

I remember screenshots of DynaCadd when it first came out. Looked amazing.

A further followup - a google search revealed this:

http://www.atarimax.com/freenet/freenet_material/
6.16and32-BitComputersSupportArea/8.OnlineMagazines/showarticle.php?167

(that should be all one line)

-Its an interview on Znet with the DynaCadd people-

"Dave/Nate-ISD> The upgrade cost from DynaCADD 1.84 to 2.0 is US $99.95 or the equivalent in Canadian dollars, about $119.95 this week. And yes, we have finally changed our cartridge port dongle and replaced it with a small, tiny, little, unobtrusive joystick key. We now have all the neccessay ingredients in-house for proper Digitizer support,

including DynaCADD specific templates as well as the accessories to
drive the CRP Digitizer."

So it looks like it plugs into the joystick port. I'm assuming #2 since
you're using the mouse in the program. :)

Hope this helps Barry.

> Is there a program for the Atari that will play WMV files?

Didier Mequignon ported the Unix mplayer program a while ago, so maybe it
could play some WMV files. However most codecs required are win32/x86
only, and on Linux/x86 for example, mplayer uses wine as a library to load
win32 codecs.

Nope, just got a long list of stuff and this wasn't at the top :)

Anyway here is the scoop:

Ok, got a chance to look at the docs and compared them to your page of document and specs.

It looks that the set of binders I have is the original atari dev kit.
The date on the 'Thanks for the interest in Atari ST" is 09/27/85.

It has the following:

Software:
Utilities Disk
Compiler Disk
Linker Disk
RCS (Resource Construction Set) ALPHA version

MicroEMACS

Documentation:
Non-Disclosure Agreement
Screen Resolution Memo
6 copies of the Software Performance Report
Introduction to GEM Programming (references to IBM-PC)
GEM VDI Programmers Guide Volume 1
GEM AES Programmers Guide Volume 2
GEM DOS Specification, rev 13 May16,1985

 Hallo,

> I'm searching for specifications of the 1st word document format.
> Does anyone know where to find them?

Theree was a description of the 1st Word+ format in the german magazine
"ST Computer". I dont know which number, but i can search for the
article if you want to have a copy.

Hi,

my auto folder order is :

_ DFB_AUTO.prg (boot selector)
_ CT60XBIOS.PRG
_ DSPXBIOS.PRG
_ CKBD.PRG
_ CLOCKY.PRG
_ NVDI.PRG
_ EXTENDOS.PRG
_ CENTSCREEN.PRG
_ SOCKETS.PRG
_ MINT040.PRG

I have SLIP.XIF and SCC.XDD in C:\MINT

I have tested to replace scc.xdd and slip.xif by hsmodem drires but no results.

ACC :

_ Cops.1.08 (I have tested 1.09 version but he can't load all active cpx. He read 16 cpx max. If I try to reload, I have 8 cpx. I have

tested with copsload too, but same problem)
_ N.Fileselector
_ CT60 Temperature
_ Mint Setter
_ St Guide
_ M player 2.9b

CPX :

_ SESSION.CPX (Extendos)
_ BUBBLE.CPX
_ CLOCK.CPX
_ COMPOSE.CPX
_ MOUSE030.CPX
_ CT60CONF.CPX
_ FILEINFO.CPX
_ NCACHE.CPX
_ NPRNCONF.CPX
_ NVDICONF.CPX
_ NCONTROL.CPX
_ WCOLOR.CPX
_ DFREE_VF.CPX
_ GENERAL6.CPX
_ HDDRCONF.CPX
_ IMPRESS.CPX

If anyone help me,

Thnaks a lot,

Cyril.

Hi all,

While MagiC and N.AES allows programmers to specify which char (by setting WHITBAK flag, plus position of the underscore in bits 8-14 in OBJ_STATE) in a button text that should host an underscore, does anyone know if the AES is also responsible for handling the actual keyboard short cut?

*That is, should FORM_KEYBD() detect that a particular key combo, for example ALT+D, is defined and report back to the app that the corresponding button was pressed? (From what I can tell, MagiC will for example report that the key even was not used/eaten by FORM_KEYBD whereas XaAES will, and then report back that an EXIT button was pressed)

*Or is the AES in this case just displaying an underscore on a button text character, and nothing else...? (Which would seem like a rather crippled implementation, so I hope this is not the case)

Regards,

/Joakim

Hi all,

Anyone else tried Teradesk under MagiC-PC, and noticed very weird
(lagging response, and strange redraws) related to live moving and
sizing of the Teradesk windows?

Regards,

/Joakim

I have DB3 and it works with floppies, hard disks and SCSI tape drives. I am not sure about ZIP drives. It may if the computer views the disks as a hard disk. Jaz drive backup may be possible, but I never tried it out.

I have version 2.2 of Pagestream. It was the last version. Nice program.
I use Calamus SL 2006 now, but PageStream is still on my STe hard drive. Too
good to just toss away. I never used That's Write.

Seems good to me. The only different with my setup is that I used the
HSMODA drivers (drvin.prg, scc.prg) and MiNT kernel 1.15.X

I never has used ppp-connect with newer kernels.
Maybe you can try it out with the 1.15.12 package (if these works on
CT60's?).

AFAIK, there is a problem with Cops 1.09. I use 1.08 myself.

I wished I could help you more but it just too far back in time (2001)
to remember me the details.

M_player suports all kind of formats (mov, avi, mpg, flm, fli, flc,
flh, gif, dl, bat, cdh, cdl, cdv, seq, dlt) but no wmv.

wine a library?

1st Word as an e-mail editor? What's wrong with Everest or Qed?

It's *bad enough* people sends e-mails in html format, don't make it
worser by sending e-mails nobody, except those with 1st Word, can
read.

Anyway 1 st Word is history. It hardly runs on modern systems.

sorry gomaskeie
 you can probally do program loops around me , but i may be able to
help.....
as far as i know the aes ,tos and vdi reference guides all have opcodes in
the rear near the index and syntax for routine mentioned ,,,gintin ,gintout
,peek global+2 etc etc ..
check them , is that what you desire.?????

charles

Well, I did say that I had never used it.
So if it does not allow the universal Text format, then
it's news to me.

Nothing wrong with Everest or Qed, I have used both.
Just came across a new 1st Word Plus package and it looked
decent. Thought I would get some input from some that have used it.

Sure does, thanks for the info.

The Dongle had me stumped as it looks to wide to fit in the
9 pin joystick port.
When I do set it up, I'm going to use one of the MouseMasters
that I have for the dongle.

Thanks Again.

It can save in ascii but 1 st word own format can only be read by a
few programs. Calamus for instance can import 1 st word docs.

My point is that if one use 1st word as a e-mail editor one will try
to use it's possibilities but now I'm think about it I believe it
would be impossible to use it as e-mail editor.
>

When it came on the market it was a very good program indeed but as
said before it's a old program which doesn't run very well on

N_AES/XaAES.

Back in time I've used it but I never managed to print the docs out properly.

Hi,

Would anyone know the whereabouts of a Tai-Pan disk image or executable?

It was one of the first games I was stuck with for months when I had my ST
in the 80's.

Anyone else have any games they were stuck with as a teenager?

Thanks,

Aly

BTW, Martin I have often wondered why you still have links to
programs on UTSI that no longer exist, such as for
Apex Alpha, and other Titan related software as well as others?

I know alot of Atari ST-Falcon users have moved to other platforms for Graphics work.

Was wondering if anyone reading this group still uses any of the Atari Graphics/Animation packages that were released?

I personally have tried to collect most all of them, and there was some really nice software created. Especially if you had a good Graphics card and or a Falcon.

Music related software was big on the Ataris for awhile.
I'm sure there are still people like me who still uses their Ataris for Music related stuff.

But I really never heard alot about the Graphics/Animation area. Anyone still using their Ataris for Graphics stuff??

If so, what Software are you using and for what uses?

Dunno, quiet like MagiC and really.  That said, once I
get these HD issues sorted am gonna have a go at MiNT and some other
replacement desktop.

What are peoples thought's on desktops?

Dave

Hi,

How do you get screen shot's of running programs or open
windows from a real Atari not an emulator?

No, the Mplayer from the unix world.

http://perso.wanadoo.fr/didierm/files/MPlayer-1.0pre4-atari.lzh
Works fine with the DVD support in Extendos.

Sure it's slow, it's just a compilation.
I have never tried crosoft files.

Didier.

Hi Martin,

I don't know if 1.15.12 run on CT60... But the Mint kernel of NAES 2.0
don't work (I don't know the version number of it)

I'll try 1.15.12.

Thanks a lot,

Cyril.

Digital camera on a tripod. Failing that, one of these TV RGB in cards for
a PC. The output from an emulator though always seems excellent and final
when compared to those methods.

Hi Dave,

Depending on which Atari you wish to take the screenshot on, there are
different solutions. If you have MiNT installed, I would say that
"GFASNAP" might be useful, saving images to *.TGA. I also recall a desk
accessory called "SNIP" which saves *.IMG files, but I can't recall if
it was just for monochrome mode or colour too.

You might perhaps also find some useful information in this thread:

http://www.atari-forum.com/viewtopic.php?t=7545&highlight=screenshot

Regards,

/Joakim

Euch, good question.
Lack of free time is one of the reasons.
Before I delete links I really want to be sure the software in
question doesn't have a link anymore. This involve lots of internet
searching, etc... Read time consuming.
In case of Apex Alpha and other Titan realated soft I think I can
delete the links.

Maybe I will work on the UTSI this weekend.
If you (or others) have new links please let me know.

TIA,

Martin

There are a few utilities you can use to maka a snapshot of the screen.

JML_Snapshot. Make a snap in (X)IMG, IFF and TIFF
German/English version
<URL:http://www.the-mclouds.de/> Follow the link software. You can get a free key (Freier Schl�ssel) to unlock the shareware restriction.

GFA Snap. Requires MiNT
<URL:http://www.bright.net/~gfabasic> Follow the link downloads

Snapper
<URL:http://www.jebnet.de/atarisoft.html>
<URL:ftp://chapelie.rma.ac.be/atari/graph-tools/snapper.zip>

TTFN

Hello,

i wonder how many kb should i reserve with SpeedoGDOS 5 for a correct use
without using too much ram? (lines in the EXTEND.SYS file)
I have 20 fonts, (TTF and SPD, no bitmap ones) and a Mega STE 4Mb.

Thanks,

Guillaume.

I'd try these three and then decide:

Thing
Teradesk
Jinnee

Jinnee is commercial though - you'll have to buy it, although I think
there is a demo somewhere. Thing and Teredesk are free, try them out first.

Hmm, I've got NAES v2.0 and easymint installed here, on my CT60
Falcon, which I believe uses 1.15.xx, AFAIK.

Thing is *not* free. It's shareware.
Personaly I use Thing 1.27 which I prefer above Jinnee. I do have
Jinnee (registrated user) but I don't like it very much.
Thing, Teradesk and Jinnee, all works fine with MiNT.

HTH,
Martin

Ok, I've a little bit exaggerated. 1st word does run on my Hades too but
it has some redraw probs (on N_AES and XaAES) and it eats all available
memory if you don't take precautions. I only let 1 st word uses ST-RAM.

All by all it doesn't runs very smoothly.

Tsch��,
Martin

Hi,

I've just moved house and have a new cable broadband service (WightCable - UK) which uses dynamic IP addresses. I have the following equipment which I'd like to use simply to share the cable link for Atari and PC, I dont need a full LAN with file/print sharing or anything else.

Motorola SurfBoard SB5101E Cable Modem
LinkSys EtherFast BEFSR41 4 port router with NAT anad DHCP server facilities
Dell Laptop PC running WinXP
Atari TT030 with EtherNEC running MagiC v6.2 and STiNG v1.26

I have had no luck in configuring the router at all to get it work with the TT. The Laptop can access the network no problem but I believe it is simply using dynamic rather than working the the static NAT addresses which I've tired to assign. The manual for hte router is next to no help, and I'm not that used to dealing the broadband links, so if anyone has any guides on how to get it all running, it'd be really appreciated, as up until now I've skirted around it by using consumer broadband for PC and dial up for Atari.

My apologies Martin. I thought that the author had released it after the
last version.

Its actually what I use - I have a registered version that I paid for.

You must give the TT a static IP address. Normally you can set that in the router setup. On a Linksys you can probably set this in the "access restriction" menu --> edit list of pc's

Then set that static address in your Sting network configuration file.
It must look like this.

```
lo0 127.0.0.1 127.0.0.0 255.0.0.0 127.255.255.255
ne0 192.168.1.4 192.168.1.0 255.255.255.0 192.168.1.255
```

The default route should point to the IP address of the router

```
ne0 192.168.1.1
```

Be aware the above examples are taken from my mintnet setup. How the syntax is for Sting I really don't know.

Would you happen to have the Apex Alpha Demo?
I know Titan was working on a followup to Apex Media which I have.
Rumors in the past say that a working Demo called Apex Alpha or Apex Audio
does exist, and I would love to have a copy of it.

If anyone has it, I would really appreciate a copy of it.

I happen to have the original manual, reference card, and original 2 disks.

Manual says version 1.1, 1Meg of memory is required and is hard drive
installable.

It looks like a interesting program,  it can read dBase, ASCII, CSV and
other
file formats such as Lotus and SuperCalc.  According to the manual.

Its a rather old program and I have never used it before.
Have you used it before? If not how did you find out about it?

If you cannot find it anywhere else, then I would probably sell it to you.

I have a free chat system set up if anyone is interested in chatting about your favorite computer. I only have a windows client available, but will be working on a linux client in the near future.

To sign up, visit http://boycot.no-ip.com/boycotchat If you don't get the confirmation email after you sign up, email me and i'll activate your account.

To get the client software, visit http://boycot.no-ip.com/software/ and click the "BoycoT Chat Client" link.

The router will have a config section where can be set a range of IP

numbers which will not be set by the router's auto-setting function,
which is what I think you're saying there Martin.

The OP needs to make sure that the TT's fixed IP address is within that range.

I was wrong though about how to set the static address. One
must look at setup/advanced routing. Here can you set the static IP of
the TT.

I have a Nova Graphics card on my Hades. I use Calamus SL 2006 alot but mainly for person use. I print out my Christmas labels every year. I not only print out the addresses, but also a little Christmas graphic scene. I use a Christmas card(s) that I received the previou year. I scan them and put them into Calamus before printing. I also use it for making up label for my video collection. There is other stuff also. I also use PhotoTip for getting pictures ready for use in Calamus.

Everest is ok, but QED does an excellent job. I am not sure about 1st Word. I
would test it out by sending myself an email just to see how it looks.
Besides, if I going to use it, I would try 1st Word Plus. It is a lot better
than the plain 1st Word and it what I use on my STe.

>Anyway 1 st Word is history. It hardly runs on modern systems.

Yes, I agree here.

I use Image Copy for this. It works best in a muti-tasking environment.

Well, Photoline ST (or TT) is a GREAT and faster and cheaper alternative
to Photoshop for everyday jobs.
Then I use GEMgraph (not for pure graphics, but for calc/pblishing)
I used OverlayII for title animations. I still thing it's great, but the
low resolution limits somehow its utility (I can use it only in
not-full-screen titling).

Hi Karsten

The UK distributors of 1st Word, GST, published a document 'Software Developers Guide for 1st Word Plus' which contains quite a lot of info about the format. What did you want to know? I could send you a photocopy if you let me have your address by email to xlator AT cix DOT co DOT uk.

Regards, /Peter/

My wife still uses it as her prefered WP program, and I use it at
times for letters etc. You may find it a bit slow for your email
purposes - if you do use it, make sure that you save the text with
'WP mode' *off* as otherwise it will use ASCII 29-31 for spaces
and add a header including a ruler.

1WP *.DOC files import fine in Papyrus and some other DTP programs.

>
>It does run on the Falcon. But you need NVDI or SpeedoGDOS.

Yes, I still use it for some of my older publications that were
written in TW3. Note that you also need Speedo *.SPD fonts - it
won't use TTFs. Furthermore, it usually caches bitmapped versions
of fonts separately for the screen and printer in larger sizes
(the minimum size is adjustable) which can take up a lot of hard
drive space - mine are 2 and 8 MB respectively. These can be
deleted, but it then takes longer to build up a bit-map before you
can use a font.

It's quite versatile, but I prefer Papyrus as it's more flexible
in things like line and para spacing, and can use TTFs.

I know the CTPCI with a Radeon video card is still very "newish", so what
I'm asking is probably still in the "not sure" stages but...

Will a CT60 Falcon, equipped with a Radeon video card, via the CTPCI still
be able to show/run/display standard Atari video? I mean, if I still
wanted to play a game, will this new setup run it?

Thanks, just trying to get my head wrapped around the concept of any Atari
besides the clones (Milan, Hades, etc) using a standard PC video card. :)

A similar problem is visible in XaAES: realtime resizing of directory windows does not work correctly. This has been fixed now (please see "New after this release" on http://solair.eunet.yu/~vdjole/teradesk.htm) and will be available in the next version of TeraDesk, to be released within a week or so. Most probably the fix will also apply to the problem yopu experienced in Magic-PC.

Hi, Lonny!

I> If you have a doc to donate, let me know.

You read the thread about the Motorola MFP? The data sheet can be downloaded from the net, but would suit your collection. I could look for the link or send it to you by eMail.

l> I apologize for the dull look, an html guru I am not. It's also not done.
l> More files yet to add. Enjoy.

About the look - I think it's right the way it is. Clearly arranged, no distracting "designer" frippery.

Thanks,

Alexander

> wanted to play a game, will this new setup run it?

It will, but on Falcons video port. So u will need either switcher or 2nd monitor. 2 monitors are not bad idea, i hope that virtual consoles in mint will run on original video and AES on CTPCI.

Baguette & croissants :)

New version of the pack dev kit environment machin running on Atari ST,
for C coding and building demos & games for the Atari Lynx.

Download on my homepage or directly in the folder
http://rajah.atari.org/files/ -> lynxdev_st020.zip

Modifications in the 0.2.0
- lynxer, make_lnx, bin2c and wav2lsf GFA rewrite
+ lynxer support more than 16 files (see doc)
- sprpck and bin2obj recompiled with PureC (BMP image no more supported)
- added original version of lyxass

Voil� :)

Hello All,

I am in process of re-installing MintNet. Things are mostly up and running. I do have get Mint connected to the Internet using my Ethernet card and I have to get X Window running. I used EasyMint and I noticed some files were not installed because of what I think is because the names wee too long. Sounds strange, but that is what I am getting. If I take the X11.tar file and extract it under Magic, things are ok. If I try the same under Mint, I am certain files are not extracted. I am getting an error that the file cannot be created and am denied access. If the name is too long what I can do to fix it? Should I use the ADDMEM program? I use it for Magic, but not for Mint. Suggestions?

Yeah, a very handy especially when you've got monitor with two SIGNAL
INPUTS!
So we need good Drivers then, and maybe good idea is to write to author of
drivers for CTPCI - RADEON. Didier Mequignon his name :)

Looking for any SCSI/IDE interface with or without HD for an Atari STe.
This
machine is fitted with a Veloce+ and their is an adapter on the board
for
the IDEal IDE interface - but I guess that's a very long shot :-)

Any other interface considered internal or external.

Cheers

Ian. (US & UK).

It is basically question of disentangling BIOS screen output
from VDI output.

I once (many years ago) used TT-Digger for this purpose
on the NOVA VDI.

This VDI took over ALL screen output.
I succeeded in removing or modifying those parts.
The result was that I got all VDI output to the colour monitor
connected to the NOVA card, and all BIOS (mostly printf) output
to the TTM195.

Everything under TOS 3.06 ROM AES.

Thus I learned that the AES exclusively used VDI.
Which was nice. :-)

Unfortunately I made a disastress mistake, totally ruining
the TT-Digger efforts.
Then I upgraded to a ATI MACH NOVA having a different VDI
binary, and I abandoned the lot.

Hi, Lonny!

l> Unless I goofed there should be an MFP doc there.

Sorry, I did expect it in the "Data Sheets" section, did not look through the "Atari DevKit" section thoroughly. Should have been thinking first ;-)

But this makes me suggest that you link to the gathered documents from an additional tree that sorts them by contents instead of the way one could obtain them originally.

Anyway, the link to the /Motorola/ 68901 Data Sheet is <http://www.datasheetarchive.com/search.php?q=mc68901&sType=part&ExactDS=Starts>. This PDF is a scan as well, so no big advantage in quality. But it seems to be more elaborate in the timing diagrams at least.

Regards,

Alexander

I have a TT/MSTE version that you select with a jumper.
What type of Nova Graphics card will work on the Hades?

I have Various DTP programs, and don't use them as much as I use to.
Years ago, I was into PageStream, recently I got a package called
QuickForms for PageStream that has a CD full of Forms, templates, fonts and
etc for PageStream and other DTP applications. There are Calamus fonts on it
as well. This package also came with 2 3 1/2 disks and a manual. Haven't
fully
explored it yet, but it has gotten me interested in DTP again.

It's hard for me to choose which way to go with DTP. I have the full
version
of PageStream, plus extra software and etc for it.
So I can use it as is, knowing I have the latest version.

I have Calamus SL, Papyrus Gold v.5, Calligrapher Gold and a few others.
PageStream is the only one I have really used so I know it well.
Papyrus Gold looks really good to me, but I would want to upgrade to the
latest version. I think version 5 supports colour, but not sure if there
are major
bugs in it that would prevent me from really using it.

I'd like to find a update release notes for each release of Papyrus Gold,
Calamus SL,

and Calligrapher Gold. I'm not sure if Calligrapher is still supported or
how far any
upgrades went. I also like to know about any printer support. These
probably use
NVDI which I have. I like the idea of using a DTP product that can use some
of
the latest printers if any. Using NVDI or Not.

I would be using the DTP software on a Falcon. Either with a standard CPU or
upgraded with CT2B or Nemesis. Or MSTE with a Nova Graphics Card.

PhotoTip, I don't recall that one at the moment. Is that anything like
PhotoLine?

BTW, do you know if Apex Media will run on the Hades?

Yes I agree Photoline is good. I was just looking thru a Computer Mag that
I got
in the mail that sells all types of Graphics/Audio software and hardware for
the PC and
Mac. Some of the prices for Graphic software was hard to believe, for
example
AutoDesk Maya 7 Unlimited runs from $7000 to $9000 US!!
It must very nice for that price.
Others run anywhere from $100 to $2000.

I've not used Overlay II before, can one still get the full version?

I have a few Genlocks that I can use for doing titles and graphics in video.
There are software only packages that can do similar results.
BitBopper, can do some amazing things. The full version was released and
still
can be downloaded as far as I know. Every Falcon owner should get this one.

I was requested several weeks ago for a design of a IDE port for STE machines.
I answered to the french guys that I need at least 100 buyers to do a design.
And after 1 month, he sent me a list of near 100 guys....

So, it is possible I will design this small simple board for STE.

I take your email and will inform you later...

Regards

Well now I found out the problem. It is not MintNet it is the Thing desktop. When I load in Jinnee I can display all the files in question, but when Thing is up I cannot as it reports the file names are too long. Any Thing experts out there. What is the latest version. I am using 1.27.

Okay, I read your other message about the Thing desktop and you're right.
That is a limitation of Thing. I've heard rumors that the last
(unreleased) version addressed this, but its not available as far as I
know. I've got v1.27 as well, registered.

Have you tried Teradesk as a replacement desktop? I believe it has support
for those really long filenames, and its still supported and being
developed.

That's a Thing 1.27 problem. The latest available version is Thing 1.27. There is also Thing 1.29 - which doesn't have that long file problem - but that version has only been distributed amongst beta tester. Some years ago there was in this newsgroup an announcement of Thomas Binder. He stated that everyone interested in the latest beta version could get it from him. Since then I wrote numerous mails to him but never got a reply back. :-(

Anyway if you feel comfortable with Jinnee do use it. It works very good under MiNT.
Under Thing 1.27 you still can see these too long files names with the shell.

I mailed Thomas a few weeks ago about that same matter and he sent me Thing
1.29 beta. However, There are still some limitations on filename lengths.
It displays longish filenames, but they are not editable. I haven't tested
thoroughly, though.

Cheers,
JFL

Any chance he's going to release that for the *rest* of the world? :-)

Hi all,

In case anyone has missed the information about NAS2006 (Nordic Atari Show), the date has been set to June 30 - July 2. Yes, this year NAS will span 3 days, something that should make it more appealing to ppl that has to travel long distances to get there.

Like the last few years, NAS will be held at Samskolan in Gothenburg. We are told that we can expect more details on NAS from the official website soon, but unless something is radically different from the event last year visitors should be able to access the computer room all around the clock. Last year, those who did not want to waste their precious money on a hotel room could grab their sleeping bag for a nap in the sleeping room.

* To monitor the official website for official news regarding NAS2006:

http://www.sak.nu/nas/index.htm

* To see which ppl that are planning on going to NAS, and to view pictures from previous NAS events:

http://nas.atari.org

Hope to see a lot of you ppl at NAS2006 :)

Regards,

/Joakim

I found out that I do have version 1.29 Beta and it does display the files in
question that 1.27 does not. It is only in German however, but that is ok. I
want to re-install Mint using Easymint and will give that a try and see just
how it goes.

>Anyway if you feel comfortable with Jinnee do use it. It works very
>good under MiNT.

Yes it does work ok, but the color is screwed up. I have N.AES version 2 and
Jinnee works best in the 16-bit mode, not the 24 or 32-bit modes. I did try
and use it to install Easymint, but it did not work too well.

I have a Nova Graphics Plus card, PCI version, with 4 meg of Ram.

>It's hard for me to choose which way to go with DTP. I have the full
>version
>of PageStream, plus extra software and etc for it.
>So I can use it as is, knowing I have the latest version.

Yes I also have PageStream. Great Program. It is on my STe.

>I have Calamus SL, Papyrus Gold v.5, Calligrapher Gold and a few others.
>PageStream is the only one I have really used so I know it well.
>Papyrus Gold looks really good to me, but I would want to upgrade to the
>latest version. I think version 5 supports colour, but not sure if there
>are major
>bugs in it that would prevent me from really using it.

YOu should use Calamus SL. It is an excellent program and offers more features
than PageStream. It is a little hard to use, but after you get the hang of it,
it's easy. I also have Papyrus Gold version 10 and it is super.

>upgrades went. I also like to know about any printer support. These
>probably use
>NVDI which I have. I like the idea of using a DTP product that can use some

>of
>the latest printers if any. Using NVDI or Not.

I also have NVDI version 5.03 and an old Epson Photo 700 color printer which does an decent job. Papyrus and Calamus uses it just fine. There is a separate module for Calamus called VDIprint which lets Calamus use any printer that I have set up with using NVDI.

PhotoTip is not really like PhotoLine but then it is. PhotoTip is meant to be used with a digital camera, but can be used without one. It also will take a photo and will allow one to change it in most any way possible.

>BTW, do you know if Apex Media will run on the Hades?
>phantomm@bellsouth.net

No, I am not sure. Have not tried that one.

But the problem is that school is stopping in France after July 4th...
So, for people coming from far and having some children it is not possible
to go the Saturday end of morning and go back for Sunday evening !
Not from France at least !

Could you not put this show the next WE ????
I may be able to come....
;-)

Hi
I've bought a Falcon with a 16 to 32 MHZ accelerator fitted in it.

The guy selling says the 16 to 32 MHZ accelerator is probably a "Powerup2"
he hasn't been able to locate the software to turn it on & off yet. Can
anyone point me to the utility that does this or to more detailed info on
the PowerUp2 accelerator. I have tried google without much success so far.

regards
Maurice

They didn't take care of the spelling, and neither the technical
details. They are only good for historical purposes, there are many
other technical references that are accurate and complete. It's a
similar story with the Falcon developer docs that I have.

Coda.

Hi,

I have verify but no change. Iconnect run correctly, dialing is ok, but iconnect stop (and freeze) at "ppp configurieren". I don't understand what's happened. With MagiC, no soucy. My configuration is : Falcon 030 with ct60 at 66 MHz / 512 Mb fast ram / 14 Mb st ram / NAES 2.0 with Mint 1.16.3 (from cvs) / Jinnee 2.5 / NVDI 5.03. In this configuration, STinG run correctly. I have tested drvin.prg and scc.prg in auto folder, same pb. I have tested scc.xdd and slip.xif to replace drin and scc, same problem. I have tested to desactivate all "exec" lines in mint.cnf and "run" lines in naes.cnf but same problem.

an idee ?

Thanks a lot for your helping.

Cyril.

I probably can't help you but I know for sure that back in the time when I was using a dial-in connection I was able to use Iconnect under N_AES 2.0/FreeMiNT 1.15.x.

If it works with current cvs freeMiNT kernel I really don't know as I don't use a dial-in connection anymore.

Anyway I think the starting order of auto prg's is important. Can you post your auto prg's (in starting order)?

Question: Why do you want to use an inferior PPP-stack instead of MiNTnet?

Hi,

I've open the TT case and disconnected the power lead which goes to the HD.   This is the right hand side lift up cover.

Ran the latest demo version of HDdriver and I get the same as before

BUS0 ACSI
BUS1 SCSI

The bee has been busy for approx 10 minutes. The option to 'Esc' makes no difference.

So it's not the HD that's corrupt then...?

Dave

Hi all,

Sat lurking in a cupboard I have a Gasteiner mega drive ASCI model.

What are peoples thoughts on setting the TT up to boot from this to
prove if its the SCSI controller thats broken.

There TT appears to function perfectly when booten from FD.

Are there any software tools to help diagnose which part for the
hardware is faulty.

Cheers
Dave

Ok this is getting stranger. With the ASCI Gasteiner mega drive
plugged in and running HD Driver 8.1 (demo) I get the following...

```
HDDRUTIL 8.16 Device Check

Operating System: TOS 3.05

Bus 0: Atari ACSI
  00.00: SEAGATE ST1096N
```

```
   Direct Access
Bus 1: Atari SCSI
  07.00: ATARI   TT     HDDRIVER 0816  Processor
```

Does this mean that the SCSI drive can now be seen?

Dave

Ok, I'm not in my home actually, but i'll verify and I post my auto
folder order. I say mint is in the last position...

For your question : Mint Net is so hard for me (I don't understand the
configuration) and I think Mintnet can't run Emailer...

Thanks a lot for your answer,

Cyril.

Hello Louis,

Long time no see.
Still reading the Atari groups after all these years?

And this week, I was able to setup a null-modem connection using PPP between my Linux box and my Falcon, to debug network code. For people interested, I made a page about setting up the null-modem PPP connection on my site.

On the networked game side, network game packets checksum routine was not endianness friendly, so I had to disable it. I was able to play a game between my two machines. Note that it was working before, but only between systems with same endianness.

Noooo its not like a PC in any way .. (if you have to compare, compare to other motorola based machines like the Macintosh or Amiga, but not that intel based monster.)

its 'just' an ST with a 030 processor and more ram, better video.. etc..

It was the 'next generation' of the ST series (and it ended up being the end of the line too)

Never got one when they were new.. now its hard to find them, espically at a reasonable cost.

Lot - A separate portion; a number of things taken collectively; all objects sold in a single purchase transaction; as, a lot of stationery;

The title says "Lot" and according to the contents it does indeed seem to fit the description.

Thanks,
Mark

It looks like it. I think something is amis. My personal expereince is that
the TT is very sensitive to termination issues. Have you removed an external
device that was terminated?

Speaking of spammers, it's a shame there's no Tandy, Atari or CP/M kit in your sale. It might have been relevant in those three groups

> This is in or around aurora, co

If you intend to sell locally, why broadcast your advert around the world?

It means that the Seagate drive can be seen and that the TT's SCSI ID
can also be seen. Looks quite normal to me.

Hi,
No there's been no other devices attached to this TT since I got it
almost 1 year ago.

Would it be worth trying a different HD and ensuring that it's
terminated.

Dave

Hi,

Does Diamond Back 3 support image backup to ZIP drives?
I have 2.51 which only supports floppies.

Hi Martin,

indeed. Yes, I'm still reading this one (not anything else on Atari),
just to keep an eye onto stuff like these Matrix cards. At times
there's some valuable info....

The Ataris themselves are fully covered with dust, tho' .... and the
strange part is that I'm not keen on selling em either.

Take care,

Louis

This article is dedicated to:

A man I met, with most of his body heavily burned, simply because he was a Chinese during the 1998 May Riot in Indonesia.
Lots of capitalists that are slaughtered during the cultural evolution.
Ten thousands of peaceful smugglers that are massacred in Banda island by the Dutch for conducting peaceful spice trade and all that are similar to them.
All minority groups and individuals that face discrimination, even genocide, for economically contributing too much for their society.
All customers that have to pay higher products due to protection of tariff and trades.
Productive people that are fined with income tax for the victimless crime of making honest money.
Smart students that are slowed down so not to move too fast.
Industries that do not get subsidy, or even banned to protect unproductive industry and laborers that earn much less due to such restrictions.
Poor starving people that could have been rich had their countries choose to embrace free market.
Women and males that are trapped in unhappy marriage which they have a hard time getting out.
Women and children that have lots of their best choices taken under the pretext of protection.
Immigrants and refuges.
Is welfare part of capitalism?
